First estimates of gross community production (23.7 g of 02 per sq m per day) and respiration (26.4 g of 02 per sq m per day) for Lake Michigan were obtained by the diurnal oxygen curve method at two inshore stations off Grand Haven, Michigan during a period of high plankton densities. Diurnal temperature changes of more than 3 deg C in the upper epilimnion resulted in partial breakdown of epilimnetic stratification leading to establishment of nocturnal isothermy. Such marked diurnal changes should be considered when interpreting surface and epilimnetic temperatures between stations because the magnitude of diurnal temperature variation may exceed station to station variability. Effects of wind mixing, internal standing waves and lateral and vertical transport appeared in the data and are discussed. Although these factors could not be neglected in Lake Michigan, the diurnal oxygen curve method performed adequately and warrants further trials on the Great Lakes. (See also W71-05561). (Knapp-USGS)

ON THE MECHANISM OF LANGMUIR CIRCULATIONS AND THEIR ROLE IN EPILIMNION MIXING,
State Univ., of New York, Albany. Dept. of Earth and Atmospheric Sciences.
Jon T. Scott, Glenn E. Myer, Ronald Stewart, and Eric G. Walther.
Limnology and Oceanography, Vol 14, No 4, p 493-503, July 1969. 11 p, 11 fig, 27 ref. OWRR Project B-015 NY (2).

Descriptors: *Water circulation, *Mixing, *Lakes, *Thermal stratification, New York, Winds, Convection, Epilimnion, Heat transfer, Limnology, Mass transfer, Currents (Water), Solar radiation, Waves (Water).
Identifiers: *Langmuir circulation, Lake George (NY).

Six mechanisms have so far been proposed to explain Langmuir circulations and their associated wind streaks. One mechanism involving shearing instability and two requiring the action of a surface film are supported by the greatest amount of evidence. Studies at Lake George, New York, suggest that more than one mechanism may operate at one location. A particular mechanism may operate at a specific site because of typical conditions at the site, but a different mechanism may be more important at another site. Plots of thermal structure in the near-surface layer of Lake George and measurements of vertical current velocities suggest that Langmuir circulations are the most important mixing process in the epilimnia of lakes. JULY CURRENTS NEAR THE SOUTH SHORE OF LAKE ONTARIO,
State Univ. of New York, Albany. Dept. of Atmospheric Sciences.
Jon T. Scott, and Dennis R. Landsberg.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 705-722, 1969. 18 p, 16 fig, 4 tab, 19 ref. OWRR Project B-015 NY (1).

Descriptors: *Water circulation, *Currents (Water), *Lake Ontario, Great Lakes, Current meters, Jets, Waves (Water), Stratified flow, Winds, New York, Water temperature.
Identifiers: *Geostrophic flow.

Drogue measurements of current speed and direction at five anchored buoys near the south shore of Lake Ontario from 11 to 20 July 1968 near Fairhaven, N.Y., showed that total transport in the 35 m layer was northeastward along the shore. However, at stations 1 and 2 km from shore there was a southwestward flowing 'countercurrent.' The maximum northeastward 'coastal jet' was computed from daily temperature soundings at 10 stations. Internal waves and wind fluctuations did not mask the baroclinic geostrophic flow for this nearshore case. Baroclinic geostrophic flow and total transport were to the northeast in the surface layers, but the analysis indicated there was a slow return flow opposed to these. Transport in deep water was, therefore, southwestward. The baroclinic geostrophic computation is a good predictor of surface currents in summer when the latter are much larger than the steady return barotropic flow. (See also W71-05561) (Knapp-USGS)

PRIMARY PRODUCTION AND CHEMICAL AND PHYSICAL CHARACTERISTICS OF LAKE ASHTABULA RESERVOIR, NORTH DAKOTA,
North Dakota State Univ., Fargo. Div. of Natural Resources.
John J. Peterka, and Leonard A. Reid.
Proceedings of the North Dakota Academy of Science, Vol 22, p 138-156, 1968. 7 fig, 4 tab, 19 ref.

Descriptors: *Lakes, *Primary productivity, *Chemical properties, *Physical properties, Reservoirs, Sampling, Phytoplankton, Analytical techniques, Temperature, Chlorophyll, Hydrogen ion concentration, Alkalinity, Phosphorus, Nitrates, Nitrites, Ammonia, Dissolved solids, Biochemical oxygen demand, Photosynthesis, Eutrophication, North Dakota.
Identifiers: *Lake Ashtabula (ND), Self-inhibition.

This study of Lake Ashtabula Reservoir, ND recorded from May to December the average phytoplankton crop as 101 g/sq m of chlorophyll a, corresponding to dry organic matter content of 121 kg/ha. The average gross photosynthesis during the same period was 2 2 g C/sq m per day. The almost continual bloom of algae is attributed to warm water and prolonged water circulation. The limited oxygen production per unit of chlorophyll may have been caused by the heavy blooms with photosynthetically inactive cells, or photosynthesis-inhibiting substance produced by the phytoplankton. Regression analysis failed to indicate any significant relationship of productivity with the contents of N and P, suggesting a possibility of an influence of some other nutrient element limiting the photosynthesis. VERTICAL DIFFUSIVITY COEFFICIENT IN A THERMOCLINE,
Department of Energy, Mines and Resources, Ottawa (Ontario). Marine Sciences Branch.
H. E. Sweers.
Limnology and Oceanography, Vol 15, No 2, p 273-280, March 1970. 3 fig, 1 tab, 7 ref.

Descriptors: *Thermal pollution, *Thermocline, Temperature, Depth, Isotherms, Lake Ontario.
Identifiers: *Vertical diffusivity coefficient, Lake mean heat content.

Two equations are presented giving the vertical eddy diffusivity coefficient, Kz, in the thermocline of a well-stratified lake as a function of its mean rate of downward displacement and intensity. Both equations are derived by transforming the heat transport equation into a quasi-Lagrangian coordinate system, the origin of which moves down with the lake mean thermocline depth. These equations can only be used to give analytical description of the downward movement of the thermocline in general terms. They cannot be used to describe the actual physical processes causing this movement nor even the changes in thermocline depth over short time intervals or in small fraction of the lake. Applications of the equations to Lake Ontario yields summer mean values of Kz in the thermocline of 0.02 to 0.07 cm sq per sec. During an exceptionally quiet period in July and August, 1967, Kz approached the value of molecular diffusivity, 0.0012 cm sq/sec. The vertical diffusivity of heat in and below the thermocline is smaller than the vertical diffusion in epilimnion. Therefore, the thermocline acts as a barrier to downward convection of heat. COLORADO SEMIDRAINAGE MOUNTAIN LAKES,
Colorado Univ., Boulder. Dept. of Biology.
Robert W. Pennak.
Limnology and Oceanography, Vol 14, No 5, p 720-725, September 1969. 6 p, 1 fig, 1 tab, 15 ref.

Descriptors: *Limnology, *Colorado, Mountains, Nitrates, Organic matter, Biological properties, Nutrients, Runoff, Overland flow, Seepage, Surface-groundwater relationships, Eutrophication.
Identifiers: Semidrainage lakes.

A distinctive semidrainage lake type is common at midmountain elevation in Colorado. Such lakes are similar in their small size, shallow depth, lack of an outlet, high nitrate content, high organic content, and high water color. 'Indicator species' are Rana pipiens, neotenic Ambystoma tigrinum, Gammarus limnaeus, an association of three leeches (Nephelopsis obscura, Glossiphonia complanata, and Helobdella stagnalis), and Nuphar polysepalum. Usually 8 to 14 species of rooted aquatics are present by late summer. Sponges are abundant, fish are absent, and plankton is sparse. Evidence is presented to show that semidrainage lakes are limnoseres. (Knapp-USGS)

A CASE STUDY OF COASTAL CURRENTS IN LAKE MICHIGAN,
Northwestern Univ., Evanston, Ill. Technological Inst.
G. E. Birchfield, and Daniel R. Davidson.
Proceedings, Tenth Conference on Great Lakes Research, Toronto, Canada, 1967: International Association for Great Lakes Research, p 264-273, 1967. 10 p, 7 fig, 11 ref.

Descriptors: *Currents (Water), *Lake Michigan, *Winds, *Current meters, *Statistical methods, On-site investigations, Eddies, Flow rates, Movement, Wind velocity, Temperature, Water circulation, Costs, Methodology, Stations, Climatology
Identifiers: *Statistical analysis (Winds and currents).

A statistical study of winds and currents is made for two adjacent buoy stations near shore in the southern basin of Lake Michigan for the late summer and autumn of 1963. Weekly mean currents and vector variances, 18-hour mean currents and transports, variance and covariance spectra are calculated for the episode. A broad southerly long shore baroclinic coastal current persisted for a number of weeks in the first part of the episode; the current shows no correlation with the wind direction, and little with the wind speed. In the latter part of the episode maximum speeds are associated with a more narrow inshore, barotropic coastal current, which is closely correlated with the wind field. The currents at the station farthest offshore exhibit very large amplitude oscillations near the inertial period, in the first part of the episode studied. (Woodard-USGS)

REGENERATION OF THE SEVAN,
Army Foreign Science and Technology Center, Charlottesville, Va.
V. Kadzhaya.
Available from NTIS as AD-715 367, $3.00 in paper copy, $0.95 in microfiche. Translated from: Nauka i Zhizn; No 3, p 60-64, 1970. Technical Translation FSTC-HT-23-1103-70, October 1970. 10 p, 6 fig.
Identifiers: *Lakes, Water supplies, *Inland waterways, Construction, Power plants, Establishments, Volume, Economics, Electric power production, USSR, Translations, *Lake Sevan, Arpa-Seven Canal, *Lake restoration.

Beginning in the 1930's the Lake Sevan was constantly reduced in size in order to supply water for the needs of hydroelectric power stations. As a result, the volume and area of the lake constantly decreased. This plan for sacrificing Lake Seven for the needs of the national economy could only continue for a period of about 50 years. Fortunately, at the end of the 50 years other conditions had arisen which have made it possible to begin work on the restoration of Lake Sevan. This article describes some of the measures which are being taken for this purpose. Emphasis is on construction of the Arpa-Sevan canal. The article is of interest to those concerned with Russian Hydroelectric Power.

2I. Water in Plants

A STUDY OF RELATIONSHIPS BETWEEN ZOOPLANKTON ABUNDANCE AND SELECTED ENVIRONMENTAL VARIABLES IN

THE PAMLICO RIVER ESTUARY OF EASTERN NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept of Zoology.
David S. Peters.
MS thesis, Dep of Zoology, North Carolina State Univ, 1968. 38 p, 4 fig, 6 tab, 50 ref. OWRR Project B-0040NC (6).

Descriptors: *Zooplankton, *Estuaries, *Copepods, Light intensity, Environmental effects, Temperature, Salinity, Turbidity, Chlorophyll, North Carolina.
Identifiers: *Pamlico River Estuary (NC), Harpoticoid copepods, Calanoid copepods, Chlorophyll-a.

The relationship between the abundance of zooplankton and environmental variables was studied from October 1965 to July 1967 in the Pamlico River estuary, N. C. The distribution of harpacticoid copepods was regulated by light, few organisms being present in the water column during the day; their increased concentration at night may have been partly due to wind-mixing. The calanoid copepods were the most frequent constituents of the estuary zooplankton. According to the results of multiple regression, their abundance was related to salinity, temperature, oxygen concentration, turbidity, light intensity, and food supply provided by phytoplankton and detritus. Temperature was particularly important in the lower part of the river, whereas oxygen concentration--in the upstream. (Wilde-Wisconsin)

ENVIRONMENTALLY-INDUCED CHANGES IN THE FATTY ACIDS OF CHLORELLA,
Maryland Univ., College Park. Dept. of Botany.
Neal G. Dickson, Raymond A. Galloway, and Glenn W. Patterson.
Plant Physiology, Vol 44, p 1413-1416, 1969. 3 tab, 17 ref. NIH Grant T01G M0097603.

Descriptors: *Algae, *Carbon dioxide, *Environmental effects, *Chlorella, Analysis, Cultures, Lipids, Metabolism, Inhibitors.
Identifiers: *Fatty acids, Chlorella fusca, Palmitic acid, Cell division, Heterotrophic culture, Autotrophic culture.

An initial investigation of why and how Chlorella accumulates fatty acids was made. Qualitative and quantitative analyses were performed on the major fatty acids of Chlorella fusca, Shihira and Krauss, in both autotrophic and heterotrophic cultures. Cells grown heterotrophically were subjected to carbon dioxide concentrations as great as 40%-in-air. The major fatty acids of autotrophic cells grown under a 1% environmental concentration of carbon dioxide, in order of concentration were 16:0, 18:3, 16:4, 18:2, 18:1 and 16:3. Analysis of heterotrophic cells at 1% carbon dioxide, by comparison, indicated a complete absence of 16:4, reduced amount of 18:3, and increased amounts of the other major acids. An increase in the environmental concentration of carbon dioxide (from 1-10%) over the heterotrophic cultures produced a 10% increase in total lipids and nearly a 50% increase in fatty acids. Palmitic acid (16:0) and 18:1 largely account for the fatty acid change by increasing from 12 mg to 33 mg/g dry weight and 8 mg to 17 mg/g dry weight respectively. Possible explanations for this enhanced synthesis of fatty acids are suggested. (Jones-Wisconsin)

ALGAL TOXINS,
New Hampshire Univ., Durham. Dept. of Zoology.
Yoshi Ikawa.
Summary of 1970 University of New Hampshire Faculty Sigma Xi Lecture delivered November 19, 1970 at Durham, New Hampshire. 4 p. OWRR Projects A-004-NH (5) and A-013-NH (3).

Descriptors: *Algal toxins, Dinoflagellates, Chrysophyta, Cyanophyta, Mortality, Inhibitors, Antibiotics (Pesticides), Red tide.
Identifiers: *Biotoxins, Ciguatoxin, Mycrocysten, Saxitoxin, Tetrodotoxin, Paralytic shellfish poisoning, Antibiotics, Acetylcholine.

Recent research identified biotoxins, including extremely potent saxitoxin and tetrodotoxin, emitted by marine and fresh water algae, predominantly dinoflagellates, chrysophytes, and blue-green species. Paralytic shellfish poisoning (PSP), fish kills, and death of birds, livestock, dogs, and even human beings are among the direct or food chain consequences. Gonyaulax catanella, Gymnodinium breve, G tamarensis, Pyrodinium phoneus, Microcystis aeruginosa, Anabaena flos aquae, and Aphanizomenon flos aquae are among the demonstrated or suspected sources of biotoxins. In this study, a small amount of unidentified inhibitor of acetylcholine esterase was isolated from Gymnodinium breve, and also a substance highly toxic to mice was extracted from the Aphanizomenon. An additional study revealed antibiotic properties of Chondrus crispus and Euthora cristata, the red algae highly inhibitory to Chlorella. (Wilde-Wisconsin)

OBSERVATIONS ON FLUCTUATIONS IN THE ABUNDANCE OF PLANKTON IN RELATION TO CERTAIN HYDROLOGICAL CONDITIONS OF RIVER GANGA,
Central Inland Fisheries Research Inst., Allahabad (India).
D. V. Pahwa, and S. N. Mehrotra.
Proceedings of the National Academy of Science, India, Vol 36, Part 2, Section B, p 157-189, 1966. 11 fig, 3 tab, 36 ref.

Descriptors: *Plankton, *Fluctuation, *Hydrologic data, Distribution, Turbidity, Temperature, Hydrogen ion concentration, Dissolved oxygen, Bicarbonates, Chlorides, Nitrates, Silicates, Carbon dioxide, Carbonates, Phosphates, Seasonal, Diatoms, Rotifers, Sampling, Depth, Color, Velocity, Width, River beds, Chlorophyta, Copepods, Cyanophyta, Protozoa, Chrysophyta, Euglenophyta, Dinoflagellates, Chlorella, Scenedesmus, Euglena.
Identifiers: *Ganges River (India).

Distribution and seasonal fluctuations of plankton, relative to physicochemical factors, were studied at seven stations on the Ganges River. Temperature, turbidity, pH, dissolved oxygen, bicarbonates, chlorides, nitrates, and silicates showed similar fluctuation trends, but free carbon dioxide, carbonate and phosphate fluctuations were dissimilar. Temperature was high December-February and low May-October. Water was turbid from July-October. Dissolved oxygen values were maximum January-February and minimum July-September. Bicarbonates, chlorides and silicates were minimal during the monsoon season, maximal during the summer. Free carbon dioxide was present July-November and absent January-May; and absent during June at some stations but highest at others. Carbonates were present only during absence of carbon dioxide. Phosphates showed erratic fluctuations with maxima during monsoon. Plankton production showed bimodal cycle with one peak in June and the other sometime during December-March; July-October showed plankton minima. Peaks of zooplankton and phytoplankton mainly coincided with each other. Phytoplankton groups were more prevalent in upper river stretches. May and June mostly recorded primary peaks of the year. Diatoms and rotifers, respectively, dominated the phytoplankton and zooplankton, except at two stations where copepods exceeded rotifers. (Jones-Wisconsin)

PERIPHYTON ACCRUAL IN THE KASKASKIA RIVER AND ADJACENT FLOODPLAIN POOLS IN EAST-CENTRAL ILLINOIS,
Illinois Univ., Urbana. Dept. of Zoology.
Edward C. Doyle.
MS thesis, Dept of Zoology, Illinois Univ, Urbana, 1971. 119 p, 23 fig, 18 tab, 88 ref. OWRR Project B-025-ILL (1).

Descriptors: *Periphyton, *Primary productivity, *Rivers, Standing crop, Biomass, Chlorophyll, Sampling, On-site tests, Illinois.
Identifiers: *Kaskaskia River (Ill), Accrual rate, Floodplain pools.

The subject of this thesis is distribution of periphyton, a rather neglected group of primary producers. The accrual of organisms on glass slides disclosed a much larger standing crop in the Kaskaskia River than in three floodplain pools. This difference in the productivity was due to the stimulating influence of river's current and the depressing shading effect in the pools. Differences in the production of separate pools are attributed to the sporadic occurrence of Ceratophyllum. The biomass and maturity of periphyton communities are influenced by composition and depth of water, concentration of silt suspension, and the position of slides. Good agreement was observed between chlorophyll a and the periphyton biomass. The high light intensity failed to decrease the surface periphyton production. (Wilde-Wisconsin)

VARIATIONS IN WATER STRESS IN ONE-YEAR-OLD NEEDLES OF A PONDEROSA PINE,
New Mexico State Univ., University Park; and Arizona Univ., Tucson.
G. L. Cunningham, and H. C. Fritts.
Journal of the Arizona Academy of Science, Vol 6, No 2, p 117-120, October 1970. 1 tab, 1 fig, 9 ref. NSF Grant GB-3658.

Descriptors: *Moisture stress, *Vapor pressure, *Ponderosa pine trees, *Semiarid climates, Seasonal, Leaves, Environmental effects, Modes of action, On-site data collections, Climatic data, Metabolism, Translocation, Plant growth.
Identifiers: *Water potential.

As part of an ongoing effort to evaluate a proposed model for the influence of climate on tree-ring width, it was desirable that the influences of seasonal variation and environmental factors on leaf water status be examined. A single ponderosa pine, growing on a semiarid site at 2500 m. elevation was chosen for study because of it's 'sensitive' ring chronology, indicating that moisture frequently limits the growth of the annual ring. Needle water potentials were measured by the dye method and soil moisture conditions and atmospheric vapor pressure were measured and correlated with leaf water potential. Eight 24 hr. sampling periods were done at weekly intervals between May 1-June 27, 1965, during which time there was a general environmental drying trend. In the first half of May, soil water potential and leaf water potential were high, and the latter showed no correlation with vapor pressure deficit (VPD). In later May, soil water potential decreased and needle water potential was linearly correlated with VPD. In June, needle water potential remained high and did not vary with VPD. It is postulated that in early May, soil moisture was adequate for maintenance of leaf tissue, but in late May, soil moisture was low and needle water deficits responded to VPD. By early June, new needles had appeared and lowered osmotically active carbohydrates by rapid translocation. (Casey - Arizona)

RADIAL WATER AND SOLUTE FLOWS IN ROOTS OF ZEA MAYS; I. WATER FLOW,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
H. Ginsburg, and B. Z. Ginzburg.
Supported by US Department of Agriculture Grant FG-IS-181, Project No A10-SWC-31. Journal of Experimental Botany, Vol 21, No 68, p 580-592, August 1970. 4 fig, 3 tab, 25 ref.

Descriptors: *Flow, *Root systems, *Estimating equations, *Laboratory tests, *Plant tissues, Vascular tissues, Structure, Corn (Field), Mode of action, Plant physiology, Osmotic pressure, Water balance, Metabolism, Permeability, Hydraulic conductivity, Model studies, Calcium, Tritium, Inflow, Ureas, Solutes, Membranes, Membrane processes, Inhibition.
Identifiers: *Reflection coefficients, *Osmotic flow.

Differential radial movements of both water and solutes across roots are difficult to study because of structural complexity of the root system. 'Sleeve' preparations are root segments from which the central stele has been removed, leaving the epidermis, exodermis, cortex and the outer part of the broken endodermis. Although very complex, they have the advantage of being less complex than the whole root system. Sleeves were prepared, mounted in paraffin wax baths and perfused with tritiated water (HTO). When osmotic pressure differences were zero, steady state fluxes of HTO were then measured and permeability coefficients were estimated. Bathing the sleeve with DNP, a metabolic inhibitor, results in a small increase in HTO influx but in no change in efflux. Using standard flow equations, hydraulic conductivity and reflection coefficients of urea and sucrose could be calculated at known osmotic pressure differences and measured volume flow rates. The reflection coefficients were very close to 1.0. Effects of the metabolic inhibitors, DNP, CCCP and KCN, were tested on osmotic flow. At high inhibitor concentrations there was a remarkable inhibition of water flow, but almost no effect on sucrose permeability, indicating that changes in osmotic water flow could be attributed to changes in hydraulic conductivity. Several models of water flow through root tissue are discussed in light of the data. It is concluded that most of the water moving radially moves by some route additional to cell walls and is probably coupled to some chemical reactions. (Casey - Arizona)

THE ROLE OF SUCCULENT HALOPHYTES IN THE WATER BALANCE OF SALT MARSH RODENTS,
California Univ., Los Angeles. Dept of Zoology.
Harry N. Coulombe.
Oecologia, Vol 4, No 3, p 223-247, 1970. 5 fig, 3 tab, 40 ref.

Descriptors: *Salt marshes, *Rodents, *Halophytes, *Physiological ecology, *Nutrient requirements, Water balance, Animal physiology, Osmotic pressure, Chlorides, Electrolytes, Water loss, Evaporation, Saline water, Saline soils, Animal behavior, Vegetation effects, Environmental effects, California, Ecosystems, Plant physiology.
Identifiers: *Succulents, *Millet, *Torpor, *Cricetid rodents.

Soil moisture in salt marshed may be 60% greater in salt concentrations than sea water, leading to the designation of salt marshes as 'physiological deserts' Southern California salt marshes are inhabited by a number of succulent halophytes and by 3 species of cricetid rodents, Peromyscus maniculatus, Reithrodontomys megalotis (Harvest mouse) and Microtus californicus (Meadow mouse). Since fresh water is nonexistant in these areas, succulent halophytes may play a role in water balance and ecology of the rodents. Data are therefore needed on the amount of physiologically available water in the plant tissues and the osmoregulatory abilities of the animals. Hydraulic pressure sap extractions from Salicorna virginica (pickleweed) yielded average Cl ion concentrations of 955 mEq/L. and a total osmotic pressure (TOP of 1450 mOsm/L. Several other local species were analyzed and one--Suaeda fruticosa--showed increases of TOP and root depth with distance away from the lagoon's edge. Harvest mice lost an average 1.35 mg water/cc oxygen consumed through pulmocutaneous evaporation, which is among the highest water losses known for small mammals. In testing for possible water sources, different groups of harvest mice were placed on 1 of 3 regimes: (1) Pickleweed only (mean water content of 84.7% fresh weight), (2) millet only (free water content of 6% by weight and (3) Pickleweed and millet. Meadow mice were tested only on (3). The harvest mice survived only on the millet diet while meadow mice could survive on (3). Weight loss and urine analyses also led to the conclusion that succulent plants are unimportant to the normal water economy of salt marsh rodents. Possibly, harvest mice may survive short term dehydration by undergoing daily torpor. The possible roles of dew and sea water as water sources are discussed. (Casey - Arizona)

EFFECT OF TIME OF EXPOSURE TO SALINITY ON GROWTH, WATER STATUS AND SALT ACCUMULATION IN BEAN PLANTS,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research; and Hebrew Univ. Jerusalem (Israel).
A. Meiri, E. Mor, and Alexandra Poljakoff-Mayber.
Supported by Israeli Ministry of Agriculture and Israeli Board. Annals of Botany, Vol 34, No 135, p 383-391, March 1970. 1 fig, 3 tab, 25 ref.

Descriptors: *Leaves, *Salinity, *Plant physiology, *Evapotranspiration, *Plant growth, Osmotic pressure, Chlorides, Potassium, Sodium, Calcium, Magnesium, Hydrogen ion concentration, Conductivity, Laboratory tests, Light, Turgidity.
Identifiers: *Water potential, *Relative water content.

Plants have shown abilities to adapt themselves to saline media, but the basic adaptive mechanisms involved are not understood. Since transpiration has been shown in some cases to facilitate absorbed ion transport in some plants, an attempt was made to investigate correlations between transpiration during salinity exposure and the growth, water status and ionic composition of the plant. Using non-saline (-0.6 bars) and saline (-2.8 bars) media, 2 series of experiments were carried out in bean plants. In one series, plants were grown continuously in either saline or non-saline media. In the second series one group was grown in saline medium during the day and non-saline at night, while conditions were reversed for the other group. The results showed that in bean plants, under conditions of relatively low evapotranspirative demand, transpiration during salinity exposure affects neither salt accumulation in the leaves nor any other effects normally associated with salinity exposure. Sap chloride levels were directly proportional to time of exposure to salinity, whether in the light or dark. K uptake also seemed proportional to time in saline media. The larger plants were exposed to saline media, the more anions were replaced by chloride. Cation levels were not significantly changed. (Casey - Arizona)

ENVIRONMENTAL EFFECTS ON WOOD PRODUCTION AND CAMBIAL ACTIVITY IN ZIZIPHUS SPINACHRISTI (L.) WILLD.,
Tel Aviv Univ. (Israel). Dept. of Botany.
Nili Liphschitz, and Y. Waisel.
Supported by a grant from the Citrus Board of Israel. Israel Journal of Botany, Vol 19, No 4, p 592-598, 1970. 4 fig, 1 tab, 10 ref.

Descriptors: *Trees, *Plant growth, *Soil-water-plant relationships, *Environmental effects, *Moisture availability, Modes of action, Seasonal, Ecology, Leaves, On-site investigations, Semiarid climates, Xylem, Phenology, Light, Laboratory tests.
Identifiers: *Israel, *Seedlings, *Cambium, *Tree rings.

Z.spina-Christi is a lowland thermophilic, shrub-like tree with a diffuse porous type xylem, native to Israel. Since it occurs in areas with differing water regimes, an attempt was made to investigate environmental control of cambial activity and annual ring features. Two groups of trees, near each other, were selected from an area about 200 m. below sea level. The first group (I) was situated on the shore of a lake where the tree roots were submerged in water. The second group (II) were scattered about the sides of an east-facing mountain side. Quantitative differences were seen between the 2 groups. With group I, cambial activity (monthly mean cell-layer production) was bimodal, with growth starting in April, peaking in May, declining to zero in June and peaking again in August. Group II showed cambial activity only in the spring. Flowering periods and leaf development were found to be associated with cambial activity, and both were strongly affected by water, indicating the water availability, in that region, is the key environmental factor which governs both the duration and rate of cambial activity. This was reinforced by increased cambial and phenological activity in a wet year. The effects of water on the radial growth seem to be indirect and mediated by the buds. Laboratory tests indicated no photoperiodic effects, either on the length of cambial activity or the type of wood product. (Casey-Arizona)

HYDRODYNAMIC EFFECTS OF SEEPAGE ON BED PARTICLES,
Utah State Univ., Logan. Dept. of Civil Engineering.
Gary Z. Watters, and Manam V. P. Rao.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY3, Paper 7973, p 421-439, March 1971. 19 p, 11 fig, 11 ref. NSF Grant GK913.

Descriptors: *Seepage, *Sediment transport, *Alluvial channels, Hydrodynamics, Groundwater movement, Surface-groundwater relationships, Sediments, Sedimentation, Reynolds number, Porous media.
Identifiers: Hydrodynamic drag, Hydrodynamic lift.

The effects of effluent and influent seepage on the hydrodynamic forces acting on an idealized non-cohesive sediment particle were investigated experimentally. The hydrodynamic conditions near and within the porous medium of the channel bed were simulated through the use of shear-velocity Reynolds number and seepage Reynolds number. Drag and lift forces on a sediment particle were measured by a force dynamometer with and without the effects of effluent or influent seepage flow. The results are presented in the form of drag and lift coefficients as functions of shear-velocity Reynolds number for different effluent or influent seepage Reynolds numbers. The effects of seepage on the dynamic forces acting on a sediment particle are analyzed to explain the observed experimental results. (Knapp-USGS)

SEDIMENTS OF THE NORTHERN MIDDLE AMERICA TRENCH,
Woods Hole Oceanographic Institution, Mass.
David A. Ross.
Geological Society of America Bulletin, Vol 82, No 2, p 303-321, February 1971. 19 p, 12 fig, 4 tab, 24 ref. ONR Contract N00014-66-C-0241.

Descriptors: *Sedimentation, *Sediment transport, Deposition (Sediment), Geology, Stratigraphy, Sediments, Marine geology, Provenance, Sedimentary structures, Sediment distribution, Sediment yield, Sedimentation rates.
Identifiers: *Middle America Trench.

The Middle America Trench is a tectonically unstable area in which sediments have accumulated rapidly. Little sediment accumulates permanently on the continental flank seaward of this basin. Sediments from the seaward flank have more biogenous material due to a lower rate of terrigenous deposition. Heavy minerals, coarse sands in the trench, facies similarities, displaced Foraminifera, and a textural gradation along the trench axis suggest that the sediments in the trench were deposited by turbidity currents. Carbon-14 dates indicate sedimentation rates as high as 146 cm/1000 yrs in the trench bottom. Assuming constant conditions, the sediments found in the trench bottom would have taken only 4.5 million yrs to accumulate. Sediment thicknesses vary along the trench axis but are consistent with present ideas of platetectonics. Sedimentary facies of the Middle America Trench and the Gulf of California are similar due to the predominance of tectonic factors over depositional factors in these areas. (Knapp-USGS)
W71-05844

FORMATION OF LEE-SIDE LAMINAE IN AEOLIAN DUNES,
Geological Survey, Denver, Colo.; and National Park Service, Yellowstone National Park, Wyo.
Edwin D. McKee, John R. Douglass, and Suzanne Rittenhouse.
Geological Society of America Bulletin, Vol 82, No 2, p 359-378, February 1971. 20 p, 10 fig, 5 tab, 16 ref.

Descriptors: *Dunes, *Sedimentary structures, Aeolian soils, *Sands, Deposition (Sediments), Sediment transport, Moisture content, Beaches, Dry masts, Wind erosion, Winds.
Identifiers: *Sand dunes, *Eolian dunes.

Processes responsible for structures in sand dunes consist of (1) primary deposition by saltation and creep and by settling from suspension, (2) redeposition accompanying avalanching, and (3) penecontemporaneous erosion. Characteristics of dune structures were examined in the field by introducing marker beds of magnetite at times of sand deposition, thus recording original surfaces and making possible the determination of subsequent changes. Avalanching in sand is of two types: sand flow and slumping. Deformational structures characteristic of each were recorded in the field and were reproduced in the laboratory. Analysis of these structures suggests criteria for distinguishing compressional types (lower dune slope) from tensional types (upper dune slope). The analysis of deformational structures also serves to distinguish between forms developed in cohesive sand and those in non-cohesive sand. Since the degree of cohesion is largely a function of the amount of moisture in the sand the structures provide a means for recognizing original moisture content. (Knapp-USGS)

THE ORIGIN OF THE LABYRINTH, WRIGHT VALLEY, ANTARCTICA,
Waikato Univ., Hamilton (New Zealand). School of Science.
M. J. Selby, and A. T. Wilson.
Geological Society of America Bulletin, Vol 82, No 2, p 471-476, February 1971. 6 p, 6 fig, 10 ref.

Descriptors: *Weathering, *Geomorphology, *Antarctic, *Salts, *Joints (Geology), Erosion, Glaciers, Floods.
Identifiers: Wright Valley (Antarctica), Salt weathering.

The Labyrinth is an area of 30 sq km of steep-sided troughs, some with no outlets, cut into a sill of the Ferrar Dolerite Formation. Hypotheses for its origin include fluvial erosion by meltwater in an interglacial stage, a volcanically induced flood, jokulhlaup, glacial erosion, and sub-glacial erosion. These hypotheses are rejected as having no field evidence in their favor. It is suggested that selective salt weathering working along major joints and in areas of close-jointing is an hypothesis supported by the field evidence that it is essentially uniformitarian. (Knapp-USGS)

SUBAQUEOUS SLUMP STRUCTURES,
Brooklyn Coll., N.Y. Dept. of Geology.
Edward Sturm.
Geological Society of America Bulletin, Vol 82, No 2, p 481-483, February 1971. 3 p, 2 fig, 10 ref.

Descriptors: *Sedimentary structures, *Sedimentation, *Landslides, Deposition (Sediments), Bottom sediments, Marine geology.
Identifiers: *Subaqueous slump structures.

Curved, grading into planar, discordant slump scar surfaces are not uncommon in sedimentary rocks. It is suggested that the slump movement took place penecontemporaneously with the processes of sedimentation and in response to loading imbalances due to the presence of a slope. The curvature of the slump surface may be derived by resolving the vector representing the displacement, or offset, and relating its vertical component to the volume decrease associated with void ratio reduction. The particular shape of the surface is largely a function of the clay mineral content of the sediments. (Knapp-USGS)

SEDIMENTS OF THE MODERN NIGER DELTA: A SUMMARY AND REVIEW,
Reading Univ. (England).
J. R. L. Allen.
In: Deltaic Sedimentation, Modern and Ancient, Morgan, James P. and Shaver, Robert H., editors, The Society of Economic Paleontologists and Mineralogists Special Publication No 15, 138-151, November 1970. 14 p, 6 fig, 22 ref.

Descriptors: *Deltas, *Sedimentation, *Sedimentary structures, Deposition (Sediments), Sediment transport, Waves (Water), Bed load, Suspended load, Sedimentology, Stratigraphy, Coastal plains, Flood plains, Swamps, Beaches.
Identifiers: *Niger Delta (Africa).

The modern Niger delta exemplifies a type of delta in which sand as well as mud is supplied to a receiving water body of high energy. The depositional environments, and corresponding sedimentary facies, are distributed concentrically within the deltaic region. The deltaic plain is divisible into the floodplain (upper and lower), tidal swamp, and beach-barrier environments. The depositional environments present in the submerged part of the delta are: river-mouth bars, delta-front platform, prodelta slope, and open shelf. There are also in the submerged part of the delta large areas where littoral and subtidal sands due to the Flandrian transgression are still exposed at the surface of sedimentation. The deltaic deposits decrease horizontally in grain size from the floodplain to the open shelf but vertically increase in coarseness from the silty clays of the open shelf to the predominantly fine- to medium-grained sands of the floodplain. (Knapp-USGS)

DEPOSITIONAL SEQUENCES AND SAND DISTRIBUTION IN THE POSTGLACIAL RHONE DELTA COMPLEX,
Shell Development Co., Ventura, Calif.
Eppo Oomkens.
In: Deltaic Sedimentation, Modern and Ancient, Morgan, James P. and Shaver, Robert H., editors, The Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 198-212, November 1970. 15 p, 10 fig, 1 tab, 17 ref.

Descriptors: *Deltas, *Sedimentation, *Texas, *Gulf of Mexico, *Sedimentary structures, Deposition (Sediments), Sediment transport, Bed load, Suspended load, Sedimentology, Stratigraphy, Coastal Plains.
Identifiers: *Rhone Delta (France).

An analysis of the lithological relationships in the postglacial Rhone delta complex of France shows that the deltaic sediments can be grouped in one of the following depositional sequences: (a) transgressive sequences, (b) regressive sequences, and (c) channel-fill sequences. Transgressive sequences are due to a process whereby the rate of subsidence exceeds that of sedimentary buildup. This process leads to deposition of a sediment body in which coastal plain deposits are overlain by coarse-grained coastal barrier deposits that are in turn overlain by marine deposits. Regressive sequences are due to a process whereby sediment-laden river water enters a basin that is filled with water of higher density (for example, sea or lagoon). This process produces a sediment body that contains fine-grained sediment at its base and dominantly coarse-grained sediment at its top. Channel-fill sequences are due to a process whereby a decrease in current velocity occurs in a channel. This process produces a sediment body that contains coarse-grained sediment at its base and dominantly fine-grained sediment at its top. (Knapp-USGS)

SEDIMENTATION IN A MALAYSIAN HIGH TIDE TROPICAL DELTA,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
James M. Coleman, Sherwood M. Gagliano, and William G. Smith.
In: Deltaic Sedimentation, Modern and Ancient, Morgan, James P. and Shaver, Robert H., editors, The Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 185-197, November 1970. 13 p, 17 fig, 5 ref. ONR Contract Nonr 1575 (03), Task Order NR 388 002.

Descriptors: *Deltas, *Sedimentation, *Texas, *Gulf of Mexico, *Sedimentary structures, *Tropical regions, Deposition (Sediments), Sediment

transport, Bed load, Suspended load, Sedimentology, Stratigraphy, Coastal Plains, Wet climates, Monsoons.
Identifiers: *Klang-Langat Delta (Malaysia).

The compound delta of the Klang and Langat Rivers on the Malay Peninsula illustrates the processes, morphology and sedimentary framework associated with a number of small high tidal deltas found in tropical southeast Asia. Both the delta and its catchment basin are located in the wet tropics and have mean annual rainfall ranging from 80 to 110 inches. Wave-energy levels along the delta coast are low to moderate. However, the range of mean spring tides is 14 feet; therefore, tidal processes dominate sediment dispersal patterns and control delta form. Characteristics of the delta include parallel ridge-and-trough bottom topography on the sea floor in the delta vicinity, large areas of low tide flats, complex networks of streams that serve the dual function of tidal streams and river distributaries, extensive mangrove swamps, and large fresh-water peat swamps. Associated with these features and environments are distinctive sedimentary facies. (Knapp-USGS)
W71-05858

HYDROGRAPHY, SEDIMENT DISPERSAL, AND RECENT HISTORICAL DEVELOPMENT OF THE PO RIVER DELTA, ITALY,
South Carolina Univ., Columbia.
Bruce W. Nelson.
In: Deltaic Sedimentation, Modern and Ancient, Morgan, James, P. and Shaver, Robert H., editors, The Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 152-184, November 1970. 33 p, 27 fig, 3 tab, 37 ref. Grant GP-525 NSF1.

Descriptors: *Deltas, *Sedimentation, *Sedimentary structures, Deposition (Sediment), Sediment transport, Waves (Water), Bed load, Suspended load, Sedimentology, Stratigraphy, Coastal plains, Flood plains, Swamps, Beaches.
Identifiers: *Po River Delta (Italy).

Significant parameters of the Po Delta, Italy, include a mountainous source area near the site of deltaic deposition, a freshwater discharge of nearly 1,500 cubic meters/ second, a sediment load that consists predominantly of sand and silt, a tidal range of 60 centimeters, a quiet sea of high salinity, and a locus of deposition on a shallow shelf that subsides slowly in the vicinity of the delta. The artificial form of the modern delta is caused by manmade works constructed in historical times to control the distributaries. Today 60 percent of the river flow and 75 percent of the sediment load discharge through a single distributary. The delta advances in front of the controlled distributaries at rates that are very much higher than those that characterized the prehistoric delta. Profiles of salinity, temperature, and suspended sediment concentration obtained within the distributaries, in front of the delta, and in the Adriatic Sea illustrate the kinds of interactions between fresh and salt water that lead to sediment dispersal and deposition. (Knapp-USGS)

FACIES AND DEVELOPMENT OF THE COLORADO RIVER DELTA IN TEXAS,
Esso Production Research Co., Houston, Tex.
William H. Kanes.
In: Deltaic Sedimentation, Modern and Ancient, Morgan, James P. and Shaver, Robert H., EDITORS, The Society of Economic Paleontologists and Mineralogists Special Publication No 15, p 78-106, November 1970. 29 p, 25 fig, 5 tab, 65 ref.

Descriptors: *Deltas, *Sedimentation, *Texas, *Gulf of Mexico, *Sedimentary structures, Deposition (Sediments), Sediment transport, Bed load, Suspended load, Sedimentology, Stratigraphy, Coastal Plains.
Identifiers: *Colorado River Delta (Tex)

The recent delta of the Colorado River of Texas is an exceptional model for analyzing sediment and faunal facies relationships in environments associated with deltas. Because of the delta's small size it is feasible to obtain closely spaced cores to provide the information essential for making a detailed facies study. Moreover, air photographs document (1) growth from a linear shoreline to the lobe-shaped deposit formed prior to artificial channeling of the river through a barrier island and (2) development of an 8- to 10- foot-thick platform of deltaic sediments, which divides Matagorda Bay, during the 6-year period following removal of an upstream log jam. This study of delta progradation was concentrated in the northeastern part of the Colorado delta, an area unaffected by manmade modifications. Continuous cores and borings define the deltaic facies complex and the underlaying bay facies. The sequence of facies and environments from the surface downward is (1) delta-plain root-mottled clay and silt (1 to 5 feet thick) with 'algal crusts' giving way locally to massive and burrowed clays of the channel-fill environment; (2) delta-front sand (2 to 8 feet thick), characterized by small-scale crossbedding, which grades laterally into finer grained sediment; (3) prodelta reddish-brown laminated silty clays (1 to 5 feet thick); and (4) bay laminated and burrow-mottled silty clays and clayey silts (10 to 14 feet thick), which lie unconformably on the Pleistocene. THE QUALITATIVE DISTRIBUTION OF FELDSPARS IN SURFICIAL BOTTOM SEDIMENTS FROM LAKE ONTARIO,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
Richard L. Thomas.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 364-379, 1969. 16 p, 8 fig, 3 tab, 8 ref.

Descriptors: *Bottom sediments, *Lake Ontario, *Mineralogy, Great Lakes, Sedimentation, Sediment transport, Bed load, Suspended load, Provenance, Deposition (Sediments), Sampling, Data collections, Weathering, Water chemistry, Paleoclimatology.
Identifiers: *Feldspars.

A qualitative assessment of the feldspar distribution in Lake Ontario sediments was made by the determination of the feldspar end members, K, Na and Ca, on sediment residues after fusion with potassium pyrosulphate. Both K adsorption and cation exchange of Na and Ca for K in standard feldspars was observed. Cation exchange is minimal in samples and in standards with a full particle size range. K adsorption is high yet appears to be constant and not directly related to grain size. In the inshore zones a poor positive correlation of feldspar to quartz is believed to be the result of poor mixing in a traction load sediment. In the basin zones the relationship is of a higher order and reflects natural sorting by sedimentation from a suspended load. The regional distribution of the feldspars shows an inshore to offshore decrease, initially, of calcic feldspar, then of sodic feldspar leading to a basin enrichment of the potash feldspars, microcline and orthoclase. The feldspars a probably derived predominantly by coast line er sion of glacial deposits surrounding Lake Ontari (See also W71-05561) (Knapp-USGS)

GEOLOGICAL, CHEMICAL, AND PHYSICA ATTRIBUTES OF SEDIMENTS IN SENEC LAKE, NEW YORK,
Hobart Coll., Geneva, N.Y.; and Michigan Uni Ann Arbor. Dept. of Meteorology and Oceano raphy.
Donald L. Woodrow, Thomas R. Blackburn, and Edward C. Monahan.
In: Proceedings Twelfth Conference on Gre Lakes Research, May 5-7, 1969, University Michigan, Ann Arbor: International Associatio for Great Lakes Research, p 380-396, 1969. 17 p, fig, 7 tab, 11 ref, append. US Navy Contra N70024-68-C-0190, Underwater Sound Lab.

Descriptors: *Bottom sediments, *Sedimentatio *Sediment transport, *Lakes, Suspended load, Be load, Mineralogy, Particle size, Profiles, Glaci drift, Seismic studies, Sounding, Stratificatio Stratigraphy, Bathymetry, Water chemistry.
Identifiers: *Seneca Lake (NY).

In Seneca Lake, New York, coarse-grained heterogeneous sediments cover the bottom nea the shoreline; fine-grained, cohesive clays occur o the lake slope; and very fine-grained, non-cohesiv muds are found on the floor of the deep lake. Clay comparable to those exposed on the lake slope ar overlain at the top of the slope by near-shore sedi ments and at the base of the slope by deep lak sediments, suggesting that the lake slope sediment are the oldest ones sampled. Values of chemica and physical parameters are plotted and contoure on maps of the Lake. The contours are generall parallel to bathymetric contours. Oxygen value are highest in near-shore sediments, sulfide an chloride values are highest in the deep lake sedi ments, and pH is near neutrality in all sediments Densities of the sediments range from 1.85 near th shoreline to 1.05 in the deep lake. The shea strength of near-shore sediments is approximately three times that of deep lake sediments. Seismi data indicate that the bedrock profile is a broad 'V and the total thickness of the lake sediments varies from about 600 ft in the axial part of the Lake t zero at, or near, the shoreline. A complex series o lake-filling events is indicated but the presently operative processes of clastic transport appear t account for much of the younger material making up the fill. THE UPLAND FOREST VEGETATION OF THE BOIS BRULE RIVER BASIN, TRIBUTARY TO LAKE SUPERIOR,
Wisconsin State Univ., Superior. Dept of Biology.
Donald W. Davidson.
Wisconsin State University, Superior, Center for Lake Superior Environmental Studies, Contribution No 17, 1970. 13 p, 21 ref. OWRR Project A-023-Wis (5).

Descriptors: *Forest soils, *Forests, *Sediment control, Erosion control, Forest management, Water conservation, Soil erosion, Surface runoff, Drainage effects, Lake Superior, Watersheds (Basins), Wisconsin, Sediment load, Sampling, Soil stabilization, Vegetation.
Identifiers: *Brule Basin (Wis), Red clay soils.

The Brule River Basin (Wisconsin) was the study site on upland forest vegetation in conjunction with studies of sediments and water chemistry of the

Brule River. Dominant tree species were sampled in 51 stands, representative of various stages of xeric northern forests. Most of the Brule Basin is presently forested, serving as an important water control agent; uncut forested land decreases the sediment load transported to Lake Superior. Clear-cutting clearing on red clay will result in a raised water table and may prove disastrous. Some erosion problems arose from farming practices, road construction, and right-of-way operations through the red clay zone. Observations indicate that the south shore of Lake Superior is partially caving in due to unknown causes. A red clay soil area of 380,000 acres is severely eroded and produces high sediment loads to Lake Superior; stabilization vegetation of exposed red clay surfaces is emphasized. Land use and proper land management are critical considerations to the ecology of the Great Lakes. (Auen-Wisconsin)
W71-05987

THE NET EXCHANGES OF PHOSPHORUS BY ESTUARINE SEDIMENTS IN FLOWING WATERS,
North Carolina State Univ., Raleigh. Dept. of Zoology.
Herbert L. Davis, III.
MS thesis, Dep of Zoology, North Carolina State Univ, Raleigh, 1968. 41 p, 3 tab, 23 ref, 3 append. OWRR Project B-004-NC (7).

Descriptors: *Phosphorus, *Sediments, Sands, Mud, Transport depletion, Water pollution sources, Water pollution effects, Model studies, Estuaries, Analysis.
Identifiers: *Net mass transport, Phosphorus exchange, Formaldehyde.

Sand and mud from the Pamlico Estuary (NC) were placed into two sets of troughs while a third set of troughs was left without sediment. Estuarine water was gravity fed through the troughs either untreated or enriched in potassium phosphate with or without formaldehyde. The net mass transports of reactive and unreactive phosphorus were recorded by analyses. As indicated by student's t test, significant mass transports were obtained for mud sediment which retained dissolved reactive phosphorus. No significant mass transport was obtained for sand due to its low retention capacity. A suggestion is made that the variability of the results could be decreased by the use of chemostat water pumps, phosphorus-32, and larger samples. (Wilde-Wisconsin)

THE MATTHES ROLLING DIAMETER AS AN INDICATOR OF CHANNEL STABILITY,
Ministry of Works, Wellington (New Zealand). Water and Soil Div.
H. F. Nevins.
Journal of Hydrology (New Zealand), Vol 7, No 1, p 47-50, 1968. 4 p, 1 fig, 1 ref.

Descriptors: *Sediment transport, *Bed load, Gravels, Channel morphology, Discharge (Water), Sedimentation, Sediment load, Tractive forces.
Identifiers: *New Zealand.

In mature rivers, the rolling diameter of the largest stone on the deepest part of the bed, together with the bank-full depth, will give an indication of the river slope. 'Rolling diameter' is defined as that diameter on which a stone rolls as if it were a barrel. These observations are easily made, and a high degree of accuracy is not necessary. The method was applied to a number of New Zealand rivers. Most of the first observations made showed reasonable agreement with the Matthes diagram. Observations made on stable reaches, particularly after a flood, gave a good fit, almost invariably in the torrent part of the diagram. When the reach was unstable, or the bed was masked by smaller swelling shingle, there was no fit. The method therefore provides a useful guide to the state of equilibrium of the reach. If there is no fit, then the bed is masked by sediments usually smaller than those required or the formation of a stable bed. (Knapp-USGS)

GEOCHEMICAL SURVEY OF MISSOURI, PLANS AND PROGRESS FOR SECOND SIX-MONTH PERIOD (JANUARY-JUNE, 1970).
Geological Survey, Denver, Colo. Regional Geochemistry Branch.

Geological Survey Environmental Geochemistry Report, June 1970. 60 p, 7 fig, 10 tab, 24 ref.

Descriptors: *Geologic investigations, *Chemical analysis, *Soil-water-plant relationship, Water analysis, *Missouri, Analytical techniques, Methodology, Laboratory tests, Spectrophotometry, X-ray fluorescence, Colorimetry, Gravimetric analysis, Test procedures, Geology, Soil tests, Vegetation, Aquifers, Groundwater, Aquifer characteristics.
Identifiers: *Environmental Health Center (U of Mo), Atomic absorption.

This is the second-six-month progress report on studies in environmental geochemistry in the State of Missouri initiated on behalf of the Environmental Health Surveillance Project in July, 1969. The studies provide general information pertaining to the occurrence and distribution of chemical elements in rocks, soils, plants, and water throughout the State. Because the environmental geochemistry studies in Missouri may extend over a considerable period of time, perhaps 5 years, it is important to maintain consistency in laboratory methods from the beginning of the project to the end. This will insure that observed geochemical variation reflects actual variation in the materials sampled rather than changes in laboratory methodology. The analytical methods for rocks, soils, plants, and water are presented. The phase of the project directed at the water of the State so far has been concerned with the problems of sampling underground waters, as these are expected to best represent the geochemical environment. (Woodard-USGS)

UREA CONVERSION TO AMMONIA IN WATERLOGGED SOILS,
Louisiana State Univ., Baton Rouge. Dept. of Agronomy.
R. D. Delaune, and Wm. H. Patrick, Jr.
Soil Science Society of America Proceedings, Vol 34, No 4, p 603-607, July-August 1970. 5 p, 7 fig, 3 tab, 12 ref.

Descriptors: *Ureas, *Hydrolysis, *Ammonia, *Soil water, *Saturated soils, Chemical reactions, Ionization, Chemical properties, Rates, Timing, Volatility, Methodology, Test procedures, Agriculture, Rice, Chemical analysis.
Identifiers: *Urea hydrolysis, *Ammonia volatilization.

There was little or no difference in the rate or extent of urea hydrolysis in waterlogged soils and in soils kept at one-third bar moisture. Under both moisture conditions, urea hydrolysis proceeded at an initial rate of about 8 to 12 ppm per hour and began to level off after about 24 hours in most of the soils studied. About one-half to three-fourths of the urea was converted to ammonia after 3 to 4 days of incubation. The soil pH at which maximum conversion of urea occurred was about pH 8 for both moisture conditions. Ammonia loss from surface applied urea was slightly greater under one-third bar moisture conditions than under waterlogged conditions, although in neither case was the loss large at moderate rates of urea application. Ammonia loss was very low from surface-applied ammonium sulfate. In flooded soils the conversion of surface applied urea to ammonia took place in the soil and not in the flood water. (Woodard-USGS)

GEOCHEMICAL SURVEY OF MISSOURI, PLANS AND PROGRESS FOR FIRST SIX-MONTH PERIOD (JULY-DECEMBER, 1969).
Geological Survey, Denver, Colo. Regional Geochemistry Branch.

Geological Survey Environmental Geochemistry Report, December 1969. 49 p, 8 fig, 15 ref.

Descriptors: *Geologic investigation, *Soil-water-plant relationships, *Geology, *Geochemistry, *Missouri, Soil chemistry, Chemical properties, Soil analysis, Geological surveys, On-site investigations, Vegetation, Rock properties, Grasses, Trees, Chemical analysis.
Identifiers: *Environmental Health Center (Univ of Mo).

This survey is being made on behalf of the Environmental Health Center of the University of Missouri, and is intended to estimate the abundance and distribution of elements in rocks, soils, vegetation, and water throughout the State. The principal effort during the first 6 months (July to December, 1969) of the project has been in gaining a familiarity with the rocks, soils, and vegetation of the State. Some preliminary sampling programs designed to estimate the chemical variability in soils and selected vegetation were executed and examinations were made of contamination in rocks, soils, and vegetation along highways. The observations are based principally on the results of about 500 preliminary analyses. The very large amounts of lead and zinc present in the roadside trees, contrasted with the small amounts in trees away from the road, strongly suggest that the high values resulted from road contamination. The upper limit of analysis for lead was 5,000 ppm. (Woodard-USGS)

ON THE OCCURRENCE OF TRANS-3-HEXADECANOIC ACID IN CHLORELLA CELLS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Plant Physiology.
G. L. Klyachko-Gurvich, V. E. Semenenko, and A. G. Vereshchagin.
English summary. Biokhimiya, Vol 35, No 4, p 808-814, 1970. 1 fig, 4 tab, 26 ref.

Descriptors: *Cytological studies, *Organic acids, *Lipids, *Chlorella, Biochemistry, Metabolism, Analytical techniques, Light, Nitrogen.
Identifiers: *T3H, *Trans-3-hexadecanoic acid, Linolenate, Palmitate, Chloroplasts.

The partition and gas-liquid chromatography revealed that the X-acid of lipids in Chlorella cells is the trans-3-hexadecanoic acid (T3H), which comprises up to 3.5% of the total content of fatty acids. In nitrogen-starved cells, the T3H constitutes 2.0 to 4.9% of the tri-gliceroids. With an increase in light intensity T3H concentration increases from 1.7 to 4.8%. A positive correlation was established, at different light intensities, between the T3H content and the concentration of linolenate and palmitate. Consideration is given to the possibility of a participation of the T3H and linolenates in the biosynthesis of chloroplast lipids. (Wilde-Wisconsin)

CONDITIONS AFFECTING THE REDUCTION OF IRON AND MANGANESE BY BACTERIA IN THE ORE-BEARING LAKES OF THE KARELIAN ISTHMUS,
Akademiya Nauk SSSR, Leningrad. Institut Tsitologii.
E. P. Troshanov.
Microbiology, Vol 38, No 4, p 634-643, 1969. 1 fig, 5 tab, 8 ref.

Descriptors: *Iron, *Bacteria, *Manganese, *Demineralization, Lakes, Oxides, Aerobic bacteria, Carbohydrates, Nitrogen compounds, Bottom sediments, Oxygen, Enzymes, Hydrogen ion concentration, Oxidation-reduction potential, Ions, Organic acids, Soil bacteria, Water purification, Adsorption.
Identifiers: *Karelian Isthmus (SSR), Ferric hydroxide.

Wide distribution and variety of bacteria which reduce iron and manganese oxides in bottom deposits of Karelian Isthmus lakes have been studied, together with the effect of anaerobic conditions, sources of ferric oxide, carbohydrates, and nitrogen-containing compounds influencing ability of bacteria isolated from bottom deposits to reduce iron and manganese. Iron reduction increases in the majority of strains under conditions of oxygen deficiency, and decreases only in the case of aerophilic strains, manganese reduction is affected by anerobic conditions to a lesser degree. Freshly precipitated ferric hydroxide is reduced more intensively by weak and vigorous strains than is iron ore. Oxidized nitrogen (potassium nitrate) inhibits iron reduction by all strains, especially by those of low activity, without affecting manganese reduction. Effect of carbohydrates on the capacity of bacteria for iron reduction varies, depending on a combination with a nitrogen-containing component and on the strain species. Bacterial cultures reduce iron by an enzymatic process; reduction of manganese oxides partially proceeds by oxidation-reduction reactions with reducing substances. Unlike iron, small amounts of manganese ions are found in sterile substrates with reducing sugars or with some organic acids. (Jones-Wisconsin)

METHODS FOR CHEMICAL ANALYSIS OF FRESH WATERS.
Hydrobiologisch Institutt, Nieuwersluis, (Netherlands); and Westfield Coll., London (England).

International Biological Programme Handbook No 8 (Second Printing), 1970: Blackwell Scientific Publications, Oxford and Edinburgh. 166 p, 29 fig, 15 tab, 157 ref.

Descriptors: *Water analysis, *Methodology, *Chemical analysis, *Water chemistry, *Conferences, Laboratory tests, On-site tests, Water properties, Inorganic compounds, Organic compounds, Colorimetry, Chromatography, Fluoremetry, Electrophoresis, Flame photometry, Spectrophotometry.

This manual is based on discussions during the IBP (International Biological Program) Technical Meeting Chemical Environment in the Aquatic Habitat, held in Amsterdam and Nieuwersluis, October 10-16, 1966. Methods of analysis for groups of compounds were considered by working groups, and the edited reports of the chairmen of these groups form the basis of the manual. This manual of chemical methods is meant as a guide for research workers interested in those biological processes in fresh water, that lead, with interconversion of energy, to the production of organic material. The chemical environment is important for many of these processes and the methods may help to describe it. Many of the methods are intended for application only to filtered water. Some may also be used for particulate matters as well. As a rule, only those methods are included which have been tested in use, either by participants of the technical meeting or in limnological laboratories known to them. The working conditions in limnological research vary from field work to laboratory work in advanced institutions. Keeping this in mind this manual is conceived on three levels of refinement of methods with differences in the necessary experience, exactitude and complexity of equipment or apparatus involved. Most determinations are therefore described-if possible-at three different levels, although the different levels are often variations on one theme. (Woodard-USGS)

SODIUM, MAGNESIUM, AND CALCIUM SULFATE ION-PAIRS IN SEAWATER AT 25C,
Oregon State Univ., Corvallis. Dept. of Oceanography
Dana R. Kester, and Ricardo M. Pytkowicz.
Limnology and Oceanography, Vol 14, No 5, p 686-692, September 1969. 7 p, 5 tab, 28 ref.

Descriptors: *Water chemistry, *Sulfates, *Sea water, Calcium sulfate, Sodium sulfate, Magnesium, Ions, Chemical reactions, Equilibrium.
Identifiers: Ion-pairs (Sea water).

The stoichiometric association constant of CaSO4 ion-pairs was found to be 10.8 plus or minus 0.7 at 25C at an effective ionic strength of 0.67 and at 1 atm pressure. The percentages of free and ion-paired species in seawater were calculated from the experimentally determined association constants of NaSO4, MgSO4, and CaSO4 ion-pairs. The results were used to calculate the effective ionic strength of seawater and to account for the difference in activity coefficients in seawater and in single-salt solutions. (Knapp-USGS)

EFFECT OF TEMPERATURE ON THE pH OF SEAWATER,
Kiel Univ. (West Germany). Institut fuer Meereskunde.
Joris M. Gieskes.
Limnology and Oceanography, Vol 14, No 5, p 679-685, September 1969. 7 p, 5 tab, 18 ref.

Descriptors: *Hydrogen ion concentration, *Water temperature, *Sea water, Carbonates, Carbon dioxide, Equilibrium, Measurement, Water chemistry, On-site tests, Laboratory tests.
Identifiers: *Water temperature-pH relations.

The temperature coefficient of the pH of seawater, calculated from existing data on the carbonate system in seawater, was confirmed experimentally as ..0.0114 pH units per degree Celsius at 1 atm pressure. Direct pH measurements on seawater are accurate only to about 0.02 pH units hence computations of components of the carbonate system are uncertain by 1% in bicarbonate and 5% in carbonate. These uncertainties can be halved if pH values are derived from precise determination of other components of the carbonate system, such as alkalinity and total CO2. (Knapp-USGS)

EH AS AN OPERATIONAL PARAMETER IN ESTUARINE STUDIES,
Commonwealth Scientific and Industrial Research Organization, Cronulla (Australia). Div. of Fisheries and Oceanography.
M. Whitfield.
Limnology and Oceanography, Vol 14, No 4, p 547-558, July 1969. 12 p, 10 fig, 30 ref.

Descriptors: *Oxidation - reduction potential, *Hydrogen ion concentration, *Sea water, *Estuaries, Instrumentation, Water analysis, Water chemistry, Chemical potential, Chemical reactions, Water quality, Aqueous solutions.
Identifiers: Estuarine water.

Quantitative interpretation of Eh measurements in natural aqueous systems is difficult because of problems associated with the technique of measurement, the performance of the inert metal electrode, and the thermodynamic behavior of the environment. However, the parameter is useful as a semiquantitative indicator of the degree of stagnation of a particular environment. A compound probe is described that reduces the technical problems and enables pH, Eh, and pS (-2) measurements to be made simultaneously on a single sample. With this probe, Eh can be used as an operational parameter to map the distribution of estuarine sediments. (Knapp-USGS)

entifiers: *Keweenaw Waterway (Mich).

he Keweenaw Waterway of the Upper Peninsula Michigan is a drowned pre-glacial river valley in nich the Sturgeon River and several smaller reams meet with the waters of Lake Superior in a anner which is physically similar to that which ocrs in an estuary. Chloride ion concentration, mperature and natural fluorescence have been idied at various depths and various stations in the aterway over the past 22-month period. Waters ntaining as high as 150 ppm chloride move into e Portage Lake from Torch Lake during the riod of winter stagnation forming three distinct ers according to water source. After spring overn there is a uniform concentration of about 30 m chloride. Wind-driven currents of Lake Surior water enter the Waterway during the mmer as a dense cold wedge on the bottom. By e end of fall overturn, the chloride concentration s been reduced to about 6 ppm by flushing acn. The relative contribution of water from the ee major sources is estimated by solution of uations involving chloride concentration and ural fluorescence. (See also W71-05561) (Kpp-USGS)

EUTROPHICATION STUDIES OF A SHALLOW INLET ON VANCOUVER ISLAND,
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.
Michael Waldichuck.
Journal Water Pollution Control Federation, Vol 41, No 5, Part 1, p 745-764, 1969. 15 fig, 2 tab, 14 ref.

Descriptors: *Estuaries, *Flushing, *Eutrophication, Water pollution effects, Water pollution control, Tides, Effluents, Sampling, Salinity, Temperature, Nutrients, Canals, Dredging, Water pollution sources.
Identifiers: *Vancouver Islands (Canada), *George Narrows (Canada), *Portage Inlet (Canada), Seasonal variations.

While nutrient input into Portage Inlet (British Columbia) is not large, volume of the system is small and flushing mechanism so poor that nutrients tend to concentrate. Phosphates and nitrates are absorbed by plankton and deposited. Provincial Government plans for a canal from Thetis Cove to Portage Inlet with locks for flushing the system rapidly appears a solution. Ecology will be modified and summer temperature in Portage Inlet will be reduced, making it less suitable for bathing--a small price for cleaner water to be regularly replaced by tidal action and for navigation improvement. Dredging might restore the inlet system removing much of the nutrients fixed in the sediments and rooted vegetation, but can be only a palliative if nutrients sources from the drainage system are not eliminated. Effect on ecology is unknown. It is conceivable that removal of rooted aquatics would lead to greater availability of nutrients to plankton resulting in undesirable concentrations of 'red tide' type organisms. (Jones-Wisconsin).

STUDIES OF MARINE ESTUARINE ECOSYSTEMS DEVELOPING WITH TREATED SEWAGE WASTES,
North Carolina Univ., Chapel Hill; and North Carolina Univ., Morehead City. Inst. of Marine Sciences.
H. T. Odum, and A. F. Chestnut.
National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report for 1969-70, May 15, 1970. 364 p, 167 fig, 80 tab, 81 ref, append. NSF Grant No GH-18.

Descriptors: *Estuaries, *Water pollution effects, *Biological communities, *Interfaces, *Foods, Ecosystems, Waste water (Pollution), Sewage, Salinity, Bacteria, Photosynthesis, Algae, Animals, Aquiculture, Artificial use, Model studies, North Carolina.
Identifiers: *Morehead City (NC), *Calico Creek (NC), Treated sewage, Energy circuit.

The test grounds of this study include a small estuary, Calico Creek (North Carolina), and three ponds which accept estuary water enriched in sewage after secondary treatment. Three control ponds receive tap water and estuarine water. The report provides in a graphic form salinity regime, photosynthetic productivity and respiration, concentration of phosphorus and nitrogen, and population dynamics of bacteria, algae, and animals. A possibility is advanced of attaining an interface system between municipal wastes and normal estuaries that would provide a medium for aquiculture and waste purification. FUNGAL SURVEY IN WASTE PONDS AND CREEK,
North Carolina Univ., Chapel Hill. Dept. of Botany.
B. Rao, and W. Koch.

Studies of marine estuarine ecosystems developing with treated sewage wastes. National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 287-310, May 15, 1970. 4 fig, 10 tab, 9 ref.

Descriptors: *Fungi, *Estuaries, Salinity, Water pollution effects, Biodegradation, Decomposing organic matter.
Identifiers: *Morehead City (NC), *Calico Creek (NC), Treated sewage, Phycomycetes, Ascomycetes, Deuteromycetes, Fungi imperfecti.

The study during June and July (1969) revealed the presence in the control and sewage-enriched waters 8 phycomycetes, 6 ascomycetes, and 7 fungi imperfecti species. Phycomycetes were largely confined to water and sediments, whereas other species, to plant material. Investigation revealed a pronounced effect of salinity on the growth of fungi. Control ponds had the greatest number of phycomycetes and lesser number of ascomycetes than polluted ponds; both types of basins had equal density of fungi imperfecti. A suggestion is made that fungi participate in decomposition of organic matter and aid in purification of waste. (See also W71-06012) (Wilde-Wisconsin)

CHARACTERISTICS OF SPARTINA MARSH WHICH IS RECEIVING TREATED MUNICIPAL SEWAGE WASTES,
North Carolina Univ., Chapel Hill. Dept. of Zoology.
David E. Marshall.
Studies of marine estuarine ecosystems developing with treated sewage wastes. National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 317-356, May 15, 1970. 24 fig, 7 tab, 10 ref.

Descriptors: *Salt marshes, *Sewage effluents, Water pollution effects, Tidal marshes, Estuaries, Nutrients, Decomposing organic matter, Bacteria.
Identifiers: *Calico Creek (NC), *Morehead City (NC), Treated sewage, Spartina alternifolia, Littorina irrorata, Melampus bidentatus.

This study compared an effluent-fertilized and a natural salt marsh through an annual cycle. On the basis of general appearance, the waste receiving marsh in Calico Creek produced a higher biomass of Spartina alternifolia than the natural marsh, thus indicating a beneficial effect of fertilization. The augmented growth of Spartina and its rapid decay were paralleled by a high population of snails, particularly Littorina irrorata. The increased activity of bacteria and rate of decomposition of organic tissues is attributed to the release of nutrients by dead Spartina grass and Melampus snails. No significant difference was detected in the subsurface salinity of the two marshes. (See also W71-06012) (Wilde-Wisconsin)

MOLLUSCAN STUDIES,
North Carolina Univ., Chapel Hill; and North Carolina Univ., Morehead City. Inst. of Marine Sciences.
A. F. Chestnut.
Studies of marine estuarine ecosystems developing with treated sewage wastes. National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 280-286, May 15, 1970. 5 fig.

Descriptors: *Mollusks, *Brackish water, Saline water, Hydrogen ion concentration, Clams, Water pollution effects, Oysters, Model studies.
Identifiers: *Calico Creek (NC), *Morehead City (NC), Treated sewage, Rangia cuneata, Crassostrea virginica, Mercenaria mercenaria, Aequipecten irradians.

The survival of mature clams, Rangia cuneata, indicated the extremely wide amplitude of tolerance of these organisms to reaction of water ranging from pH 3.0 to 10.0. The low salinity precluded the survival of hard clams, Mercenaria mercenaria, and bay scallops, Aequipecten irradians. Particular attention was given to the growth of common oyster, Crassostrea virginica. The mortality of mature oysters in polluted ponds was about 50% higher than that in control ponds. Both the survival and growth rate of oyster spat were appreciably higher in control ponds. (See also W71-06012) (Wilde-Wisconsin)
W71-06015

CRUSTACEANS AND FISHES IN THE SEA GRANT PONDS,
North Carolina Univ., Chapel Hill. Dept. of Environmental Science and Engineering.
Michael D. Beeston.
Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 272-279, May 15, 1970. 6 tab, 1 ref.

Descriptors: *Saline water, *Crustaceans, *Fish, Water pollution effects, Population, Growth rates, Sewage, Model studies.
Identifiers: *Calico Creek (NC), *Morehead City (NC), Treated sewage.

Several methods were used to sample crustaceans and fish in control and sewage-enriched ponds. Large shrimp, Benaeus aztecus and P duorarum, were found only in control ponds; small shrimp, Palaemonetes pugio, and blue crab, Calinectes sapidus, were present in all ponds. Spot, pinfish, croaker, flounder, silversides, and anchovies were found only in the control ponds. Spot was the only species caught in numbers sufficient to estimate its biomass. One of the control ponds harbored Aegathoa oculata, a crustacean parasitizing on anchovies. The fish population of waste ponds consisted largely of minnows, Fundulus heteroclitus being the predominant species. (See also W71-06012). (Wilde-Wisconsin)
W71-06016

CARBON,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
John Day.
In: Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Divsion and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 188-212, May 15, 1970. 19 fig, 5 ref.

Descriptors: *Carbon, *Brackish water, Water pollution effects, Carbon dioxide, Simulation analysis, Computer models, Sediments.
Identifiers: *Calico Creek (NC), *Morehead City (NC), Inorganic carbon, Organic carbon, Total carbon, Treated sewage, Carbon dioxide diffusion.

The ultimate aim of this study is to formulate a model of carbon flow in the system of control and sewage polluted ponds. These reservoirs were supplemented by mixing tanks. The rate of entry and drain were measured to calculate the carbon flux in aqueous phase. Carbon dioxide across the air-water interface was measured with an infrared gas analyzer. The loss of carbon was determined by analyses of sediments. The levels of total, inorganic, and organic carbon were recorded from July through November. Heavy algal blooms in July increased the organic carbon content. Both waste and control ponds showed a gradual decrease in the level of total carbon. The city water, obtained from a limestone aquifer, was very high in inorganic carbon. For most ponds, carbon dioxide diffused out of water almost continuously due to the high content of inorganic carbon in the feed water. (See also W71-06012) (Wilde-Wisconsin)
W71-06017

PHOSPHORUS FLUX BETWEEN WATER AND PLANKTON: A PRELIMINARY REPORT,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering; and North Carolina Univ., Morehead City. Inst. of Marine Sciences.
Edward J. Kuenzler, Henry McKellar, and Barbara Muse.
In: Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 180-187, May 15, 1970. 2 fig, 2 tab, 2 ref.

Descriptors: *Phosphorus, *Cycling nutrients, *Plankton, *Brackish water, Water pollution effects, Sewage, Chemical analysis, Adsorption, Model studies, Radioactivity techniques.
Identifiers: *Calico Creek (NC), *Morehead City (NC), Organic phosphorus, Inorganic phosphorus, Dissolved phosphorus, Mercury chloride, Formaldehyde, Treated sewage.

This investigation considered the effect of domestic wastes upon phosphorus cycling. Radiotracer technique was used to measure the flux of phosphorus from one compartment to another. The content of total phosphorus in waste ponds exceeding at times 60 microgram/liter, was generally much higher than that of control ponds. The relative rate of phosphorus uptake by plankton was directly proportional to particulate phosphorus and inversely proportional to dissolved inorganic phosphorus. The relative uptake rate in minutes and the turnover time in hours were calculated on the basis of the radioactivity of filtrate measured at different time intervals. Poisons, including formaldehyde and mercury chloride, were very efficient at low rates of uptake. (See also W71-06012). (Wilde-Wisconsin)
W71-06018

THE USE OF CARBON-14 FOR THE STUDY OF THE UPTAKE AND UTILIZATION OF PHYTOPLANKTON BY RANGEA CUNEATA,
North Carolina Univ., Morehead City. Inst. of Marine Sciences.
Roy Hyle, III.
In: Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 174-179, May 15, 1970. 6 tab, 5 ref.

Descriptors: *Estuaries, *Phytoplankton, *Mollusks, Clams, Cultures, Laboratory tests, Algae, Feeding rates, Model studies, Absorption, Water pollution effects, Radioactivity techniques.
Identifiers: *Morehead City (NC), *Calico Creek (NC), *Rangea cuneata, Oocystis parva, Nannochloris atomus, Carbon-14, Treated sewage.

The intent of this study is to establish utilization of Oocystis parva and Nannochloris atomus algae by filtering mollusks. Clams, Rangea cuneata, were placed in sea water diluted with distilled water to 15-20 o/oo. A sample of C-14 labelled phytoplankton was drawn and filtered at the beginning and end of feeding period. At the end of the feeding period, the clams were placed in a bowl of multipore filtered water and allowed to pump for several hours. Radioactivity of filters was determined with a Geiger counter and combusted tissue samples were counted with a Dynacon unit. The results suggested uptake and assimilation of algae by clams, but the data did not fit into the uptake-assimilation equations. (See also W71-06012). (Wilde-Wisconsin)
W71-06019

BENTHIC PRODUCTIVITY,
North Carolina Univ., Morehead City. Inst. of Marine Sciences.
Ronald Dillon, and William J. Woods.
In: Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 133-143, May 15, 1970. 4 fig, 3 tab, 3 ref.

Descriptors: *Estuaries, *Benthos, *Productivity, *Water pollution effects, Ponds, Model studies, Phytoplankton, Sewage, Oxygen, Respiration, Light, Chrysophyta, Photosynthesis, Laboratory tests.
Identifiers: *Morehead City (NC), *Calico Creek (NC), Light penetration, Treated sewage.

Benthic productivity was determined by light-dark bottle technique in a simulated estuary of polluted and non-polluted waters. To approach conditions observed in natural estuaries, submersible water pumps were mounted inside the jars. All control and one waste pond exhibited a positive net gross production. On the other hand, two control and two waste ponds showed positive net benthic production. The low productivity of some ponds is attributed to high turbidity and limited circulation coupled with high respiration. The erratic results were caused by many rain squalls during the period of study. The introduction of pumps may have been an additional source of errors. No correlation between light energy and net or gross production of all basins was disclosed. (See also W71-06012). (Wilde-Wisconsin)
W71-06020

STUDIES ON ULVA AND OTHER BENTHONIC MARINE ALGAE RECEIVING TREATED SEWAGE IN PONDS AND IN CALICO CREEK AT MOREHEAD CITY, NORTH CAROLINA,
North Carolina Univ., Chapel Hill. Dept. of Botany.
Charles F. Rhyne, and Max H. Hommersand.
In: Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 112-132, May 15, 1970. 7 fig, 2 tab, 9 ref.

Descriptors: *Cytological studies, *Benthos, *Marine algae, *Estuaries, Saline water, Marine plants, Cultures, Biomass, Salinity, Speciation, Nutrients, Sewage, Model studies.
Identifiers: *Calico Creek (NC), *Morehead City (NC), Treated sewage, Heteromorphic alteration, Ulva, Enteromorpha.

Periodic observations of benthic macroscopic marine algae in Calico Creek (North Carolina) estuary and experimental control and sewage-enriched ponds aimed to elucidate factors influencing germination, growth and reproduction of Ulvaceae. The predominant species included Ulva curvata, Enteromorpha prolifera, and E linza. Germination at the microscopic stage was triggered by temperature from 5 to 15C, whereas further development and reproduction required the minimum of 20C. The normal growth and reproduction of Ulvaceae in ponds were hindered by low salinity (1.8%) and a restricted light penetration. The species of Ulva and Enteromorpha introduced on substrate of oyster and scallop shells disappeared from the ponds by the fifth month. However, a reoccurrence of E prolifera was observed one year after its introduction. Attempts to obtain interspecific hybrids have been unsuccessful. (See also W71-06012). (Wilde-Wisconsin)
W71-06021

PHYTOPLANKTON POPULATIONS: A PRELIMINARY REPORT,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
Edward J. Kuenzler.
In: Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-1970, p 94-111, May 15, 1970. 3 fig, 2 tab, 22 ref.

Descriptors: *Brackish water, *Water pollution effects, *Phytoplankton, Model studies, Estuaries, Population, Productivity, Nutrients, Sampling, Municipal wastes, Chlorophyll, Ponds, Sewage.
Identifiers: *Morehead City (NC), *Calico Creek (NC), Nutrient cycles, Chlorophyll a, Species composition, Nannochloris, Nitzschia, Cyclotella, Oocystis, Monodus, Chaetoceros, Treated sewage.

The dynamics of phytoplankton were investigated in three control and three sewage-enriched ponds. The sampling was confined to about 10 cm depth near the centers of the ponds. The dominant species in the control ponds were Nannochloris atomus, Nitzschia frustulum, N closterium, and Cyclotella caspia. The former three species reached density exceeding 100,000 cells/ml with maximum number of cells from June to December. The waste ponds harbored largely Oocystis parva, Monodus spp, Nitzschia closterium, N frustulum, and Chaetoceros gracile; most of these were abundant in fall and early winter, but Monodus bloom was striking in April. Both associations were accompanied by small forms of algae of 1-3 micron dimensions. There was generally a good agreement between the concentration of chlorophyll-a and cell counts in each pond. The composition of algal communities may represent only successional stages in a media which are only 18 months old. (See also W71-06012). (Wilde-Wisconsin)
W71-06022

FIRST YEAR RECORD OF TOTAL METABOLISM OF MARINE PONDS RECEIVING TREATED WASTES,
North Carolina Univ., Chapel Hill; and North Carolina Univ., Morehead City. Inst. of Marine Sciences.
Howard T. Odum, Charles Hall, and Sam C. Casarchia.
Studies of marine estuarine ecosystems developing with treated sewage wastes, National Science Foundation, Sea Grants Project Division and North Carolina Board of Science and Technology, Annual Report 1969-70, p 38-93, May 15, 1970. 7 fig, tab, 5 ref.

Descriptors: *Metabolism, *Marine animals, Photosynthesis, *Saline water, Respiration, Diurnal, Ponds, Aeration, Municipal wastes, Productivity, Interfaces, Ecosystems, Aquiculture, Food chains, Oxygen, Computer programs, Light, Hydrogen ion concentration, Model studies, Sewage.
Identifiers: *Calico Creek (NC), *Morehead City (NC), *Marine ponds, Variables patterns, Aeration efficients, Insolation, Treated sewage.

Diurnal changes in oxygen concentration and corresponding calculated seasonal record of productivity are reported. Study of gas dynamics showed that aeration coefficient was less than 0.05 g carbon dioxide/sq m per hour/atmosphere partial pressure gradient of carbon dioxide. With limited diffusion the oxygen concentration was below 0.1 g/sq meter hour/0.2 atmosphere. The pond temperature followed the weather conditions and the temperature range served as an approximate radiometer for total insolation. The insolation in cal/sq cm was obtained as the difference between the ampere-hour meter readings taken at two intervals. When photosynthesis exceeded respiration, the oxygen reached a level of supersaturation and the reaction turned pH 10. The resulting replacement of carbonate alkalinity by hydroxide alkalinity was nontoxic to waterfowl. (See also W71-06012). (Wilde-Wisconsin)
W71-06023

SEASONAL VARIATIONS OF TEMPERATURE, DRIFT, AND HEAT EXCHANGE IN SURFACE WATERS OFF THE WEST COAST OF SOUTH AMERICA,
Scripps Institution of Oceanography, La Jolla, Calif.; and Instituto Hidrografico de la Armada, Valparaiso (Chile).
Warren S. Wooster, and Hellmuth A. Sievers.
Limnology and Oceanography, Vol 15, No 4, p 595-605, July 1970. 10 fig, 9 ref.

Descriptors: *Water temperature, Heat balance, Water balance, Winds, Advection, Coasts.
Identifiers: Seasonal variation, Drift, Latitude.

Wyrtki's published and unpublished climatological data are used to describe seasonal variations of surface temperature, heat exchange, surface drift, and surface winds along the west coast of South America. Although there are well-marked seasonal and latitudinal changes in the heat flux through the sea surface, the heat flux south of 2S is always positive so that advective processes must play an important role in controlling surface temperature. Some general features of the coastal upwelling regime can be seen in an analysis of heat and water balances, but the fields of current velocity and wind stress are too poorly known for unequivocal quantitative results to be obtained. STUDY OF MASS TRANSFER IN MEMBRANE PROCESSES,
California Univ., Berkeley. Sea Water Conversion Lab.
K. S. Spiegler.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $0.70. Office of Saline Water Research and Development Progress Report No 613, Jan 1971. 74 p, 2 tab, 20 fig, 18 ref, 4 append. OSW Contract 14-01-0001-1295.

Descriptors: Membranes, *Electrodialysis, *Reverse osmosis, *Ion transport, *Semipermeable membranes, *Membrane processes, Desalination, Electrochemistry, Pressure, *Mass transfer.
Identifiers: Water splitting, Streaming potential, Hydrodynamics.

Electrical potential differences across membranes were measured with both an anion-exchange membrane used in electrodialysis and a modified cellulose acetate membrane used in reverse osmosis. These measurements were performed in special apparatus which on the one hand simulated plant conditions hydraulically and electrochemically, and on the other permitted the measurement of a variety of other parameters pertinent to mass transfer (e.g. local current density, effluent concentration and effluent pH in electrodialysis, hyperfiltration rate and hyperfiltrate concentration in reverse osmosis). The results obtained point strongly towards confirmation of the original thesis viz., that electrical measurements can serve as important diagnostic tools in the study and in the control of these desalting methods. RESEARCH ON PIEZODIALYSIS - Second Report,
Ionics, Inc., Watertown, Mass.
Frank B. Leitz, Samuel S. Alexander, Dirk M. deWinter, and Charles W. Plummer.
For sale by the SOD, GPO, Wash, DC, 20402, Price $0.65. Office of Saline Water Research and Development Progress Report No 620, December 1970. 66 p, 31 tab, 9 fig. OSW Contract 14-01-0001-611.

Descriptors: *Desalination, Aqueous solutions, Ions, *Ion exchange, Membranes, *Dialysis, *Membrane processes.
Identifiers: *Piezodialysis, Mosaic Membranes, Ion exchange membranes.

Piezodialysis is a promising new, coupled-transport process for desalination of aqueous solutions. In this process a hydrostatic head forces water and ions through regions of ion-exchange resins under conditions where a permeate enriched in salt is obtained. In November 1965 a project was undertaken in the laboratories of Ionics, Incorporated, to investigate some of the conditions

under which practical piezodialysis could occur and to prepare membranes which had intrinsic properties suitable for piezodialysis. The work concentrated on mosaic ion exchange membranes consisting of small regions of anion selective material interspersed with small regions of cation selective material, each such region extending substantially uniformly from one surface of the membrane to the other. Equations were developed for predicting the maximum value of salt enrichment and the maximum allowable current path length from resin transport coefficients. The measured transport properties of several ion-exchange resin formulations were shown to be promising for piezodialysis. Performance of a piezodialysis unit expressed as production rate per unit area and as fractional recovery as product, were found to be strongly dependent on average salt enrichment. While there is too much uncertainty for accurate economic prediction, an average of 5 should make the process roughly competitive with reverse osmosis. Performance of composite membrances from styrenized polyethylene resins gave considerable support to the prediction power of the mathematical analysis. Further work on membrane synthesis led to the development of the latex-polyelectrolyte membrane. With the best example of this type a salt enrichment factor greater than 5 was obtained. BOUNDARY LAYER FLOW PROBLEMS IN DESALINATION BY REVERSE OSMOSIS,
California Univ., San Diego. Dept. of Aerospace and Mechanical Engineering Sciences.
F. A. Williams, T. J. Hendricks, and M. K. Liu.
For sale by the SOD, GPO, Wash, DC 20402, Price $1.75. Office of Saline Water Research and Development Progress Report No 622, December 1970. 230 p, 11 tab, 89 fig, 65 ref, 4 append. OSW Contract 14-01-0001-951.

Descriptors: *Desalination, *Reverse osmosis, Osmosis, Brines, *Boundary layers, Membranes, *Membrane processes, Separation techniques, *Desalination processes.
Identifiers: Concentration polarization, Boundary layer flow.

Buildup of excess salt concentration in brine adjacent to a reverse-osmosis membrane was studied experimentally and theoretically. An unstirred batch cell and a two-dimensional channel were investigated experimentally by electrical conductivity microprobes and shadowgraph techniques. These two systems and a semi-infinite flat plate were studied theoretically by perturbation methods, series expansion methods, asymptotic analyses, iterative techniques, linearization procedures, transform techniques and integral methods. Rejection-loss and diffusion-wave phenomena were identified theoretically. For the cell, experiments showed each theory holds within theoretically anticipated range of applicability; in an intermediate range of time and of ratio of osmotic to applied pressure, no theory agrees well with experiment. For the channel, experimental membrane salt concentrations agree well with predictions of an integral theory based on the experimentally verified assumption of an exponential excess concentration profile. The new integral theory can be applied easily in design calculations. Experimental observations of buoyant instability (membrane above brine) revealed convection patterns which possess wave lengths of a few millimeters and frequencies of a minute or two, for batch-cell and laminar-channel flow. Observations are correlated by convection-jet model. Buoyant convection greatly reduces average excess concentration and increases membrane flow rates. (Johnson-Office of Saline Water)
W71-06237

ECONOMICS OF COMBINING DISTILLED SEAWATER AND RENOVATED WASTE WATER AS A NEW SOURCE OF MUNICIPAL WATER SUPPLY,
Bechtel Corp., San Francisco, Calif.
J. W. Porter.
For sale by the SOD, GPO, Wash, DC 20402, Price $1.50. Office of Saline Water Research and Development Report No 617, October 1970. 97 p, 12 tab, 16 fig, 6 ref, 5 append. OSW Contract 14-01-0001-2161.

Descriptors: *Desalination, *Cost analysis, *Water reuse, *Evaluation, Model studies, *Municipal water, *Water supply, Waste water treatment, Economies.

A methodology for determining the preliminary economics of combining distilled seawater and renovated waste water to serve as a new source of municipal water supply was investigated and the results are reported. A computational procedure for determining least-cost supply from this combined source and alternative single sources was developed and is documented. The feasibility of the computational procedure (a mathematical model) is tested by application to a hypothetical U.S. coastal city. Appendices to the report include a description of the standard linear programming model (LP-600) used, discussion of the network theory applied, listings of computer sub-routines employed, verification of cost calculations and a list of cited references. (Miller-Office of Saline Water)
W71-06238

ION-SELECTIVE ELECTROCHEMICAL SENSORS,
Texas Instruments Inc., Dallas.
Isaac Trachtenberg, and Charles T. Baker.
Copy available from GPO Sup Doc, Wash, DC 20402, Price $1.00. Office of Saline Water Research and Development Progress Report No 496, December 1969. 105 p, 3 tab, 51 fig, 2 append. OSW Contract 14-01-0001-1737.

Descriptors: *Electrochemistry, *Analytical techniques, *Ions, Saline water, *Electrodes, Iron.
Identifiers: Ion selective electrodes, Non-oxide glass sensors, *Electrochemical sensors.

Several ion-selective electrochemical sensors prepared during the course of this research program have shown selective response to specific ions. The Fe (.....) sensors are the most promising sensors in this study. A chalcogenide glass (TI No 1173 - 28% Ge, 60% Se, 12% Sb) was doped with various amounts of Fe and Fe compounds. Sensors produced from this material yielded very selective response to Fe (.....), even in the presence of Fe (....). Response has been observed at concentrations as low as 0.000001 moles/liter (0.056 ppm). The preferred working range is 0.00001 to 0.01 moles/liter. The sensor has maintained its selectivity after five months in solution. The ability to reproduce the sensor has also been established. (See also W71-06240)
W71-06239

ION-SELECTIVE ELECTROCHEMICAL SENSORS - SECOND REPORT,
Texas Instruments Inc., Dallas.
Issac Trachtenberg, and Charles T. Baker.
For sale by the SOD, GPO, Wash, DC, 20402, Price $0.75. Office of Saline Water Research and Development Progress Report No 619, December 1970. 59 p, 32 fig, 3 tab, 10 ref, append. OSW Contract 14-01-0001-1737.

Descriptors: *Electrodes, *Analytical techniques, *Ions, Saline water, *Alkaline earth metals, Calcium, Magnesium, Metals, Electrochemistry, Iron, Sodium, Potassium, Sulfates.
Identifiers: Ion-selective electrodes, Non-oxide glass sensors, Solid state sensors, *Electrochemical sensors.

This is the second report on the ion-selective electrochemical sensor program; the first report was made in OSW R and D Progress Report No. 49 (See W71-06239). For the doped-1173 glass F (.....) sensors, the redox potential for the reducin agent in the glass has been bracketed between 0.12 V and ..0.18 V. In addition, activation exper ments revealed that the deterioration of potenti response with time is related to a surfac phenomenon (probably film formation). The varia tion in the rate of deterioration from one glass sam ple to the next was related to alterations in th preparation procedures. Simple chemical and/o mechanical treatment of the surface can restore th sensor almost to its original condition. Develop ment of solid state sensors for Ca (....) is anothe accomplishment made during this reporting period Of this group, the 10% YF3-CaF2 polycrystallin membrane sensor exhibited the most favorabl potential response characteristics, displaying theoretical Nernst response to the divalent cation of the alkaline earth metals (Ca (....), Mg (....), an Ba (....)). To the monovalent cations and othe divalent cations, the potential response was les than theoretical. The selectivity of the present sen sors will limit their application to certain systems When the ratio of divalent alkaline earth catio concentration to monovalent or other divalent ca ion concentration was S0.1, little interference wa noted. With higher interfering ion concentrations however, the response to the alkaline earth catio was retarded or eliminated. This is the same type o problem which plagues so many of the currentl commercially available ion-selective electrodes (Horowitz-Office of Saline Water)

K RIDGE NATIONAL LABORATORY VER-CAL TUBE EVAPORATOR PILOT PLANT NUAL REPORT FOR FISCAL YEAR 1969.
arns-Roger Corp., Denver, Colo.

sale by the SOD, GPO, Wash, DC, 20402, ce $1.00. Office of Saline Water Research and velopment Progress Report No 600, August, 70. 58 p, 14 tab, 12 fig, append. OSW Contract 01-0001-2535.

scriptors: Distillation, *Evaporators, *Conden-, *Heat transfer, *Desalination processes, esalination plants.
ntifiers: Falling film evaporation, Spray nozzles.

ummary is presented of the down-flow heat nsfer performance of enhanced surface tubes operations at the four-effect Vertical Tube porator Pilot Plant at the Office of Saline Water t Coast Test Station, Wrightsville Beach, North olina. The time period is from July 1, 1968 to e 30, 1969. Average overall heat transfer coeffi-ts in the range of 1300-2100 Btu/hr. deg F sq ft e observed for double-fluted tubes during ained runs. Summaries of overall heat transfer fficients show deterioration, presumably from ing tube surfaces, for selected data runs. Tube ace cleaning is shown to restore heat transfer ormance to clean or original levels. For each ct, overall heat transfer coefficients of the anced surface tubes appear to be related to e feed rate, expressed as evaporating brine flow nolds number. Overall heat transfer coeffi-ts for each effect are shown to be related to the perature level in each effect. Temperature ations in heat transfer coefficients can also be essed in terms of brine Reynolds number. A eral correlation for overall heat transfer coeffi-t, expressed as a function of brine Reynolds ber, appears to predict flow and temperature ations in coefficients. Down-flow coefficients shown to be essentially the same as up-flow ficients. Operation problems encountered dur-he period are discussed. The acid injection and tic neutralization system was used to control leaerator-decarbonator exit pH to an average f 6.7 with a maximum deviation for any run of or minus .5 pH units. Dissolved oxygen levels measured with Magna and Beckman oxyme-which were calibrated with Winkler tests. (See W71-06244) (Callahan-Office of Saline er)

RIDGE NATIONAL LABORATORY VER-AL TUBE EVAPORATOR PILOT PLANT - UAL REPORT FOR FISCAL YEAR 1970.
ns-Roger Corp., Denver, Colo.

sale by the SOD, GPO, Wash, DC, 20402, $1.25. Office of Saline Water Research and lopment Progress Report No 618, October 158 p, 13 ref. OSW Contract 14-01-0001-

Descriptors: Distillation, *Evaporators, *Condensers, *Heat transfer, Desalination processes, *Desalination plants.
Identifiers: Falling film evaporation, Spray nozzles.

Two long tube vertical falling film sea water evaporator pilot plants were operated at the Office of Saline Water, Wrightsville Beach Test Facility, Wrightsville Beach, North Carolina, during the period of July 1, 1969 thru June 30, 1970. The purpose of their operations was to produce accurate design data concerning heat transfer performance of enhanced surface evaporator tubes. Heat transfer coefficients at least twice smooth tube values, at similar conditions, was seen. Also performance was seen to vary directly with tube feed brine flow and inversely with antifoam level in the brine. The presence of surfactant marginally increased performance at high injection levels. The four effect train operated easily and successfully on the sump to sump mode of brine transfer. A multiphase ejector vapor compression pilot plant was completed and was ready for development testing at the end of the period. (See also W71-06243) (Callahan-Office of Saline Water)

3B. Water Yield Improvement

LAKE CHAMPLAIN IN RELATION TO REGIONAL WATER SUPPLY,
Vermont Univ., Burlington. Dept. of Zoology.
E. B. Henson, and Milton Potash.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 441-448, 1969. 8 p, 5 fig, 1 tab, 3 ref. OWRR Project A-014-VT (1).

Descriptors: *Water balance, *Water sources, *Water resources development, *Lakes, *New York, Water management (Applied), Water supply, Discharge (Water), Water yield.
Identifiers: *Lake Champlain (NY-Vt).

Lake Champlain is a deep glacial lake of the St. Lawrence drainage. It is the easternmost major contributor of fresh water to the St. Lawrence system before the St. Lawrence becomes brackish. Because of its large size (440 sq mi) and considerable depth (400 ft), Lake Champlain has been singled out as a potential regional water supply for the metropolitan areas of New England and New York City. An analysis has been made of the water budgets of the Lake to ascertain its reliability as a major water supply. The lake's outlet, the Richelieu River, has a mean outflow of 11,000 cfs, equivalent to 38% of the lake volume. The flow-through period amounts to only 2.6 years. Total input ranges from 25% to 55% of the lake volume, and the input correlates very closely with outflow, implying rapid displacement and short-term storage. Present municipal water use of the Lake amounts to 1% of the lake volume per year. Lake levels are usually at low stages when regional demands for water are greatest. It is recommended that water resource planners look to the more stable supplies of the Lake Ontario discharge as a reliable source of water or the region. (See also W71-05561) (Knapp-USGS)

OPPORTUNITIES FOR MODIFYING WEATHER TO AUGMENT PRECIPITATION AND SUPPRESS HAIL,
Colorado State Univ., Fort Collins. Dept. of Atmospheric Science.
Lewis O. Grant.
In: Frontiers in Conservation, Proceedings 24th Annual Meeting Soil Conservation Society of America, August 10-13, 1969, Colorado State University, Fort Collins, p 76-82, 1970. 7 p, 3 fig, 1 tab, 9 ref.

Descriptors: *Artificial precipitation, *Cloud seeding, *Precipitation (Atmospheric), *Colorado River Basin, Model studies, Water yield, Methodology, Rainfall, Hail, Clouds, Cloud cover, Meteorology, Climatology, Orography, Silver iodide, Coalescence.
Identifiers: Dry ice, Ice crystals.

Physical models have been developed that define conditions under which cloud seeding should have varying effects from artificial seeding of cold orographic clouds. The results of randomized artificial seeding experiments verify the conclusion that substantial increases in precipitation should be achieved when coldest cloud temperatures are in the range from about minutes 13 deg to minus 20 deg centigrade and that decrease might result when cloud temperatures are colder than about minus 26 deg centigrade. By considering the increases expected for cloud temperatures of minus 20 deg centigrade and warmer and the frequency of such occurrences in the Colorado River Basin, it is estimated that overall precipitation increases during the winter snowpack season should be 10 to 12% in the central and northern portions of the basin and 32 to 36% in the San Juan area of the southern portion of the basin. The investigations that have been carried out provide guidelines for conducting operational seeding for this type of cloud. (See also W71-06129) (Woodard-USGS)

WATER CONSERVATION BY REMOVAL OF PHREATOPHYTES,
Geological Survey, Tucson, Ariz.
Richard C. Culler.
EOS, Transactions, American Geophysical Union, Vol 51, No 10, p 684-689, October 1970. 6 p, 11 fig, 6 ref.

Descriptors: *Phreatophytes, *Brush control, *Evapotranspiration control, *Water utilization, Land clearing, Water conservation, Flood plains, Land use, Watershed management, Hydrologic budget, Groundwater movement, Wildlife habitats.
Identifiers: *Gila River (Ariz.).

Evapotranspiration from the flood plain of a major river depletes water that otherwise might be available to downstream users. Removal of phreatophytes and replacing them with grasses hav-

ing a lower consumptive use can result in higher beneficial use of water, particularly in arid regions. Benefits of added grass as forage must be compared with the loss of brush as a wildlife habitat. Comparative data are presented from a study of the Gila River flood plain, Arizona, begun in 1963. Actual evapotranspiration is computed by the water-budget method. Instrumentation is described, and surface water and groundwater budgets are shown graphically. The computed evapotranspiration for 1964 is higher than for 1967. The average for the period used in this paper is 26,000 cu m (21 acre-feet) per day for 1964 and 16,000 cu m (13 acre-feet) per day for 1967, indicating that the water conveyance efficiency of the flood plain alluvium was improved by removing the brush. SALINE ARTESIAN WATER AS A SUPPLEMENT,
Geological Survey, Miami, Fla.
Frederick W. Meyer.
Journal of the American Water Works Association, Vol 63, No 2, p 65-71, February 1971. 7 p, 10 fig, 9 ref.

Descriptors: *Water resources development, *National parks, *Florida, *Saline water, *Artesian wells, Confined water, Water quality, Salinity, Water chemistry, Hydrogeology, Water sources, Groundwater movement, Aquifer characteristics.
Identifiers: *Everglades National Park (Florida).

Large quantities of moderately saline water (less than 5,000-mg/liter dissolved solids) can be obtained from artesian water-bearing zones in the Avon Park Limestone of Eocene age--the top of which occurs at a depth of about 1,200 ft in southern Florida. Small quantities of less saline water can be obtained from artesian water-bearing zones in the Hawthorn, Tampa, and Suwannee Formations between 300 and 1,100 ft in depth. Artesian water could be used for small desalting plants in the Florida Keys and the Coastal Lowlands area at considerable savings over using sea water. The use of raw artesian water from below 1,300 ft for dry-weather biologic survival ponds in the Everglades, such as in the Everglades National Park, is infeasible because the salinity is too high for some species of plants and animals. Generally, piezometric levels, salinities, and flows increase with depth in southern Florida. (Knapp-USGS)
W71-06124

WATER USE BY COTTON FROM LOW AND MODERATELY SALINE STATIC WATER TABLES,
Agricultural Research Service, Weslaco, Tex., and Texas Agricultural Experiment Station, College Station.
L. N. Namken, C. L. Wiegand, and R. G. Brown.
Agronomy Journal, Vol 61, No 2, p 305-310, 1969. 4 tab, 4 fig, 11 ref

Descriptors: *Consumptive use, *Lysimeters, *Saline water, *Water table, *Cotton, *Water conservation, Capillary action, Salinity, Groundwater, Moisture uptake, Water use, Crop production.
Identifiers: Irrigated crop

Moderately saline static water tables occur in the semi arid and arid southwestern United States, and reduce irrigation needs. A 4-year lysimeter study determined the contribution of shallow saline water on cotton yields on permeable soils. Controlled water tables at 91-, 183-, and 274-cm contributed 54.4, 26.4, and 17.3% of total water used under high-moisture treatment, and 60.6, 48.9, and 39.2% under low-moisture treatment. Soil profile depletion, rainfall, irrigations, and water-table additions comprised the total water. Water uptake from the 274-cm table was strongly related to capillary-zone salinity. Lint yields were related to total water and capillary-zone salinity. Moderate capillary-zone salinity (EC of 10 to 14 mmhos/cm) reduced monthly and seasonal water use compared with low salinity (EC of 2 to 3 mmhos/cm). High-moisture treatment delayed seasonal water use. Tables show moisture and water-table influences, and rainfall distribution. Figures show salinity and water-use distribution, monthly water table, and relation between cotton lint yields and water use. (Popkin-Arizona)

3D. Conservation in Domestic and Municipal Use

WATER RESOURCES OF NASSAU AND SUFFOLK COUNTIES,
Holzmacher, McLendon and Murrell, Melville, N.Y.
S. C. Mclendon.
Water and Sewage Works, Vol 118, No 2, p 34-36, February 1971. 3 p.

Descriptors: *Water resources development, *New York, *Groundwater, Water yield, Safe yield, Water quality, Water pollution sources, Nitrates, Aquifers, Water supply, Saline water intrusion.
Identifiers: *Long Island (NY), Nassau County (NY), Suffolk County (NY).

Water resources studies have been underway for some time and are nearing completion for both the Long Island, New York counties of Nassau and Suffolk. There is much similarity between the two counties with respect to water supply. The major differences appear in the eastern region of Suffolk County and to a lesser extent, in southwestern Nassau County. In Suffolk County, the estimated permissive sustained yield is 466 mgd. It is predicted that four of the ten towns in Suffolk County will have deficits before 2020. These are Babylon, Riverhead, Southold and East Hampton. A high percentage of the total permissive sustained yield could be withdrawn from the Magothy formation and will be necessary where Glacial supplies are not present or where the Glacial cannot be utilized because of unacceptable water quality. The widespread detection of detergents in the shallow formations in southern Nassau County and southwestern Suffolk County, and the more recent significant increases in nitrate concentrations in wells along the central portion of Nassau and western Suffolk, show that the population is polluting its drinking water supply. When the water supply quality is preserved, so is the water supply quantity. (Knapp-USGS)

A PROGRAMMING MODEL FOR FARM IRRIGATION SYSTEMS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
James. S. Windsor, and Ven Te Chow.
Civil Engineering Studies, Hydraulic Engineering Series, No 23, (UILU-ENG-71-2003), December 1970. 95 p, 15 tab, 6 fig, 14 ref, 3 append. OWRR Project B-030-ILL (3).

Descriptors: *Irrigation systems, *Optimization, *Linear programming, *Dynamic programming, Planning, Irrigation, Irrigation efficiency, Computer programs.

This report describes the development of a programming model for farm irrigation systems. In the model, a multi-crop, multi-soil, farm irrigation system is broken down into a number of discrete units, and then analyzed by means of a two-level optimization approach. Dynamic programming is used at the first level of optimization and linear programming at the second level of optimization. To show how the procedure may be set up on a computer, a hypothetical two-crop, two-soil, farm irrigation system is analyzed considering several resource combinations.

PHYSIOLOGY OF BOLL SHEDDING IN COTTON: IV. CORRELATION STUDIES ON FLOWER PRODUCTION AND BOLL SHEDDING IN RELATION TO TEMPERATURE AND RAINFALL,
Indian Agricultural Research Inst., New Delhi.
S. N. Bhardwaj, P. N. Sharma, and R. B. Mehra.
Indian Journal of Agricultural Science, 1968, Vol 38, No 4, p 747-752. 4 tab, 1 fig, 5 ref.

Descriptors: *Cotton, *Crop production, *Plant physiology, *Flowering, Temperature, Rainfall, Analysis, Varieties.
Identifiers: *Boll shedding.

Wide temperature and rainfall fluctuations occur in the northern cotton-growing tract of India as flowering in hirsutum varieties extends from July to mid-October. Flowering and boll shedding have similar distinct peaks. Analysis of the effects of temperature and rainfall on flower production and boll shedding was made at weekly intervals in 4 hirsutum varieties. Flowering and shedding were found to be governed by interrelated internal and external factors. Flower production is governed by maximum and minimum temperatures and rainfall. Moderate rainfall and mean maximum temperature (28 to 33C) were most conductive for flowering. Boll shedding is related to the number of flowers produced. (Popkin - Arizona)

HOW TO SELECT AND APPLY ZINC FERTILIZER,
Nebraska Univ., Lincoln. Agricultural Experiment Station.
R. C. Sorensen, E. J. Penas, and A. D. Flowerday.
Quarterly Serving Farm, Ranch and Home, Vol 17, No 1, Spring 1970, p 9-11. 5 fig.

Descriptors: *Fertilizers, *Calcareous soils, *Nebraska, *Application methods, *Soil-water-plant relationships, Carriers, Nutrients, Distribu-

on, Inorganic compounds, Organic compounds, nelation, Leaching, Soil management, Climates, osts, Soil erosion, Sierozems, Lime, Crop produc- on, Acid soils, Oraganic matter.
entifiers: *Zinc, Semi-arid lands.

ldition of zinc fertilizer to soils of low soil organic atter, high soil pH, lime-rich soil, and low soil ic can increase crop yield. Semi-arid calcareous ils in irrigation-leveled or badly eroded sites in estern Nebraska are improved by zinc fertilizer. ough many fertilizers are available, soluble and ely-grained ones give even distribution and are ost effective. Zinc fertilizers include organic che- es, organic non-chelates, soluble inorganics, and oluble inorganics as carriers. Organic chelate s the best movement characteristics, though ier carriers are effective if mixed with soil on ap- cation. Cost, climatic and management factors, ier nutrient needs, application methods and car- r selection are outlined. Selection of the proper tilizer depends primarily on distribution, mobili- and cost. Figures show corn response to zinc fer- zation, influence of particle size, placement and bility, and distribution of 4 types of fertilizer in a ched soil column. (Popkin - Arizona)

ANTING CORN IN NATIVE SOD,
braska Univ., Lincoln. Agricultural Experiment tion.
E. Lane, and L. R. Robison.
arterly Serving Farm, Ranch and Home, Vol 17, 1, Spring 1970, p 12-13. 2 fig, 4 tab.

scriptors: *Planting, *Pasture management, rosion control, *Continuous farming, *Corn eld), Soil management, Stabilization, Brush con- , Herbicides, Grasses, Arid lands, Irrigation er, Soil erosion, Wind erosion, Nebraska, getation establishment, Crop production.
ntifiers: Sand hills, Cole sod planter, Native sod, quat, Atrazine.

continuous vegetation cover is needed in the braska Sandhills because wind will erode the , even while irrigation water is applied. This blem is common to arid lands. Corn grown in ss that has top grass killed gives a continuous p cover to prevent soil erosion. This is beneficial ight soils where spring and fall pasture could be d while corn becomes ensilage. Parquat- and zine-herbicide use and non-use produced ps, but the grassy control inhibited a good corn p. Three pounds of atrazine and 1 pound of aquat produced 18 bushels per acre more than 3 nds atrazine and 1/2 pound paraquat, and 19 hels per acre more than 3 pounds atrazine and pound paraquat. Yields were comparable to ventional corn production. This approach is mising to wind-erodable areas. (Popkin - zona)

GRADATION OF WATER QUALITY IN IR- ATION RETURN FLOWS,
ert S. Kerr Water Research Center, Ada, Okla.; Oklahoma State Univ., Stillwater. Dept. of onomy.
es P. Law, Jr., J. M. Davidson, and Lester W. d.
ahoma Agricultural Experiment Station, Bul- B-684, October 1970. 26 p, 9 tab, 7 fig, 27 ref.

criptors: *Irrigation water, *Return flow, ainage water, *Deterioration, *Water pollution cts, Water quality, Salinity, Groundwater, Dis- ed solids, Leaching, Salt balance, Percolating er, Pollution identification, Soil water, Saline er, Water conservation, Irrigation practices.
tifiers: *Salt water irrigation, Salt transport.

object was to determine water-quality adation in irrigation return flows, to determine ity status of a salt-water-irrigated clay loam and to relate these results to irrigation returns surface and groundwater quality. Total dissolved solids (TDS) increased 20% in the surface return flow, while percolating soil water increased 5 to 8 fold in TDS. The clay loam soil showed an increase in soluble salt after 15 years of high-salt-water irrigation (TDS of 1,430 ppm), though leaching by rain contributed a favorable salt balance. Percolating irrigation water transports about 10 tons of salt per acre-foot. Draining and percolating waters adversely affect surface and groundwater. Future studies will consider seasonal fluctuations and dynamics of soil water quality and quantity. Tables show water-table depths, water-sampling locations, schedule of operations, quality data of irrigation, drainage and groundwater, and estimated nutrient losses. Figures show salt content at time and depth of water. (Popkin - Arizona)

A COMPARISON OF WATER USE FOR HYBRID CORN IN THE BEKAA AND THE COASTAL PLAIN,
Agricultural Research Inst., Tal-Amara (Lebanon). Dept. of Irrigation.
A. Aboukhaled, and S. Sarraf.
Magon Institut de Recherches Agronimiques, Serie Technique, Publication No 12, Juin, 1970. 14 p, 3 fig, 5 tab, 8 ref.

Descriptors: *Lysimeters, *Corn (Field), *Soil moisture, *Evapotranspiration, *Irrigation efficiency, Semiarid climates, Evaporation, Solar radiation, Tensiometers, Moisture tension, Climatic data, Pans, Plant growth, Wind velocity, Water requirements, Temperature, Root systems, Moisture availability, Crop response, Advection.
Identifiers: *Lebanon, *Potential evapotranspiration, *Agroclimatology, *Moisture extraction, *Relative humidity, Class A pan, Neutron probes.

The water requirements of a hybrid corn (UH 146) were studied and compared in 2 major Lebanese agricultural areas, the central Bekaa Plain and the Northern Coast Plain (Abde). The prevailing climatic conditions (1969) in the 2 areas were compared in terms of potential evapotranspiration (PET), evaporation (E), solar radiation (R), relative humidity (RH) and wind velocity, and these were correlated with corn water use as measured by lysimeters. At the Abde site, planting occurred 1 month earlier (April) because of known climatic differences. Fertilizer applications were identical at the two sites. At the Bekaa site, 4 differing latin-square designed water schedules were applied on the basis of: (1) Readily available water in the root zone (2) Rate of water use (3) Soil moisture tension at 30 and 60 cm depth (4) Critical growth stages (tasseling to milk stage). The results showed that for similar yields, water use at Abde was about 60% of that in the Bekaa, with peak use reaching 7 mm/day at Abde and 11 mm/day at the Bekaa. The coastal water economy is due to the earlier planting, shorter growing cycle (20 days) and lower evaporative demand, resulting from an average 28% higher RH, 25% low R intensities and reduced wind velocities. In both areas corn water use exceeded measured PET during the critical growth period. The corn ET/class A pan E ratio was higher at the Bekaa due to advection on taller plants. About 4/5 of the total corn root moisture extraction occurred in the top 60-70 cm. soil layer. On the basis of this data, appropriate irrigation schedules are discussed for the 2 areas. (Casey - Arizona)

EFFECTS OF IRRIGATION INTENSITY AND NITROGEN LEVEL ON THE PERFORMANCE OF EIGHT VARIETIES OF UPLAND COTTON, GOSSPYIUM HIRSUTUM L.,
Arizona Agricultural Experiment Station, Yuma.
E. B. Jackson, and P. A. Tilt.
Agronomy Journal, Vol 60, No 1, p 13-17, 1968. 8 tab, 2 fig, 16 ref.

Descriptors: *Cotton, *Irrigation effects, *Nitrogen, *Plant growth regulators, *Irrigation efficiency, Crop production, Arizona, Soil moisture, Moisture uptake, Fibers (Plant), Fertilizers, Consumptive use.
Identifiers: *Lint.

Effects of 4 irrigation treatments and 2 nitrogen levels on performance of 8 upland cotton varieties were studied over a 3-year period on Glendale silty clay loam at Yuma, Arizona. Acala 44-10, Deltapine Smooth Leaf, DeKalb 220, Stoneville 7A, California Strains A and A-65, and Arizona Experimentals 221 and 6010 responded similarly to irrigation treatments. Highest yields were obtained under 14- to 21-day irrigation spacings with totals of 102 to 119 cm of water per season. 'Dry' irrigation treatments approached available soil moisture depletion before each irrigation and produced much lower yields for totals of 84.84 and 64 cm of water. Nitrogen (ammonium sulfate) treatments were most effective at 224 Kg N/ha with 14- to 21-day irrigations. No consistent treatment effect was found on lint percentage on fiber products. Tables show irrigation treatments and effects, statistical significance, and nitrogen effects and interaction. (Popkin - Arizona)

Identifiers: *Western U.S., *Cattle ranching, *Geographic perception, *Land alienation, Preemption Act, Homestead Act, Timber Culture Act, Kineaid Act, Enlarged Homestead Act, Stock-Raising Homestead Act.

The open, arid lands of the western U.S. were originally settled by large cattle operators. This land use ethic came into conflict with the cultural and social values of the eastern U.S. woodsman mentality, which in turn led to a century-long series of assaults by the woodsman on the cattleman's domain. The cattleman's survival was then determined by the extent to which he perjured himself and circumvented the intent and institutions of the woodsman, particularly as expressed by a series of congressional land alienation laws. The priori assumptions underlying the woodsman's position were: (1) Congressional incapability in dealing with western land problems, (2) cultural conflict, in which the ethic of small, family farm crop operations took precedence over large, partly nomadic operations and (3) geographic perceptions colored by eastern conditions which lead to misconceived land management attempts, abetted by congressional legislation, that proved inoperative in arid region grasslands. As examples of geographical ignorance, 3 major fallacious water supply concepts gained great currency at differing times and led to tragically misconceived programs. These include the theory that tree-planting increases areal rainfall, that irrigation was a panacea for widespread crop introduction and that dry land farming through fallowing was realistic. It is argued that such misconceptions still color our western land use policies and that governmental attempts to deal with the problem, even now, as in the past, result in confusion and chaos. YIELD REDUCTION BY CONTROLLED FLOODING OF CORN,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
W. F. Ritter, and C. E. Beer.
Americal Society of Agricultural Engineers Transactions, Vol 12, No 1, p 46-47, 50, 1969. 3 p, 1 fig, 2 tab, 6 ref. OWRR Project A-002-IA (3).

Descriptors: *Soil-water-plant relationships, *Crop response, *Corn (Field), *Flood damage, Experimental forms, Agriculture, Crop production, Fertilizers, Nitrogen compounds, Plant growth, Irrigation effects, Growth rates, Growth stages, Floodwater, Saturation, Test procedures, Irrigation practices.
Identifiers: *Controlled flooding, *Iowa State University.

An experiment was conducted at Iowa State University to evaluate flood damages to corn that was inundated for variable periods of time at different stages of growth. The controlled-flooding experiment was conducted on a floodplain soil with a permeable subsoil. Corn was inundated for 24, 48, and 72 hours, with approximately 6 inches of water maintained on the soil surface. Flooding treatment was applied when the corn was about 6 inches high, 30 inches high, and at the silking stage. Two different levels of nitrogen fertility were used on the plots. Results show that corn yields are affected most when flooding occurs at the early stage of growth (6 inches or less). The high-nitrogen and low-nitrogen plot yields were reduced by 20 and 35 percent, respectively, when the plots were inundated for 72 hours. There was also some reduction in yield after only 24 hours of flooding. At later stages of growth, there was little effect on flooding, except on the low-nitrogen plots flooded at the 30 inch height where yields were reduced by about 15 percent after inundation for 72 hours. (Woodard-USGS)

ESTABLISHMENT OF PERENNIAL FORAGES: I. SUBSEQUENT YIELDS; II. SUBSEQUENT ROOT DEVELOPMENT,
Iowa State Univ., Ames. Dept. of Agronomy.
D. R. Buxton, and W. F. Wedin.
Agronomy Journal, Jan-Feb 1970, Vol 62, No 1, Pt I, p 93-97; Pt II, p 97-100. 6 tab, 6 fig, 37 ref. Iowa Agricultural Journal Papers No J-6270 and J-6274.

Descriptors: *Forages, *Crop production, *Root development, *Plant groupings, *Weed control, Plant growth regulators, Soil-water-plant relationships, Growth rates, Weeds, Oats, Carbohydrates, Solar radiation, Alfalfa, Harvesting, Soil moisture, Fertility, Legumes, Rhizomes, Nutrients, Competition.
Identifiers: Sowing, Planting time, Root weights, Crownvetch, Birdsfoot trefoil.

This research examines the effects of weed control, oat companions with contrasting canopies and time of sowing on subsequent forage yields, and determines the effect of interspecies competition during growth on root weights and carbohydrate levels of perennial forages. Five establishment methods on yields of 6 perennial forages in 2 similar experiments with controls showed incident solar radiation was significantly greater under oat companion with less-dense conopy with mild weed competition. Alfalfa stands were less sensitive to interspecies competition than crownvetch and birdsfoot trefoil. Treatments in low tiller densities showed a rapid recovery by the second harvest with adequate moisture and fertility, dry summer sowing of alfalfa and 3 grasses resulted in greater yields. Interspecies competition has a greater effect on the upper 15-cm root legume yield and upper 10-cm root-rhizome grass yield than on forage yields. Lowest carbohydrate levels occurred in weeded swards when fertility and moisture were limiting factors. Minerals and water supplies by root systems were important to carbohydrate accumulation. Little differences in carbohydrate levels among treatments resulted when moisture and fertility were inadequate. Figures and tables quantify these relations. (Popkin-Arizona)

EFFECT OF IRRIGATION ON RECOVERY OF APPLIED NITROGEN BY COTTON,
Agricultural Research Service, Thorsby, Ala. Soil and Water Conservation Research Div.; and Auburn Univ., Ala. Dept. of Soils.
B. D. Doss, and C. E. Soarsbrook.
Agronomy Journal, 1969, Vol 61, No 1, p 37-40. 7 tab, 3 fig, 1 ref.

Descriptors: *Soil moisture, *Plant growth regulators, Root development, Fertilizers, Irrigation effects, Nitrogen, Cotton, Soil-water-plant relationships, Field capacity, Irrigation practices, Dry farming, Moisture uptake.
Identifiers: *Dry matter production, Irrigated crops.

Effects of soil moisture regime and nitrogen (N) rate on recovery of applied N by cotton were studied on a Greenville fine sandy loam. Irrigation increased total N uptake and decreased N percentage in plants. Applied N increased N percentage and total N uptake of plants, regardless of irrigation. Linear regression equations had slopes for N recovery on N applied for irrigated cotton twice as large as slopes for unirrigated cotton. Five years (1957 to 1959, 1965 to 1966) data for irrigated and unirrigated cotton fits the regression equation log Y equals 2.333 plus 0.727 log X, where Y is dry matter yield and X is N uptake. The cotton was grown at Thorsby (Alabama), where irrigation water was applied when 50% of available water was used in 60 cm of soil, and soil moisture and field capacity was measured gravimetrically. (Popkin-Arizona)

THE INFLUENCE OF VARIOUS SOIL MOISTURE-REGIMES ON THE YIELD AND QUALITY OF COTTON IN AN ARID ZONE,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
J. Amir, and H. Bielorai.
Journal of Agricultural Science, Camb., 1969, Vol 73, No 3, p 425-429. 4 tab, 1 fig, 14 ref.

Descriptors: *Soil moisture, *Crop production, *Cotton, *Irrigation practices, *Plant growth regulators, Drought tolerance, Water requirements, Moisture stress, Flowering, Arid lands.
Identifiers: *Lint quality, *Irrigation intervals, *Drought symptoms, Irrigated crops, Cotton lint, Cotton balls, Coastal Negev (Israel), Israel.

Irrigation is necessary to obtain high cotton yields in arid regions. Various soil moisture regimes on cotton in the coastal Negev (Israel) were investigated. Three irrigation experiments in the western Negev showed that maximum yields of 1700 to 2100 kg/ha cotton can be obtained with 3 irrigations by increasing irrigation at the beginning of flowering. About 0.31 kg of lint was produced per cubic meter of irrigation water. No differences in lint quality was detected between moisture-stress and wet-treatment cotton. Additional irrigation increased number of bolls/plant as long as there were clear drought symptoms, while average boll weight remained unaffected. Average boll weight was i creased, though there was no increase in number bolls/plant, by additional irrigation treatmen where there were no symptoms of water stre (Popkin-Arizona)

Identifiers: Irrigated crop, Seedbed preparation Vermiculite, Tablets.

Lettuce is a major irrigated crop in Arizona. O timum planting of lettuce eliminates unnecessa labor, wasteful irrigation and conserves wate More than 60 variations of seedbed preparation seed treatments, seed coatings, soil amendmen and mulch applications were field evaluated sinc 1964. Seeds encased in compressed vermiculi disks prior to planting, and controlled spacin produced the largest emergence percentage (8 90%). Tableting can be done commercially for 1 parts vermiculite, 2 parts water, 1 part polyvin acetate by weight, and compression to 1/4 origin volume. Pushing the tablet into a properly prepare clod-free seedbed accomplishes planting. Prope seed selection, treatment and tableting makes feas ble planting to a final stand and once-over harves ing. Tableting may be feasible where stan establishment or plant uniformity is needed fo other crops. (Popkin-Arizona)

Identifiers: *Reservoir design, *Storage-yield function, Decision theory, Objective function, Lagrangian method.

This book considers models of the water storage-yield relationship in order to determine the flow patterns associated with reservoir design. Early empirical solutions to the reservoir design or storage-yield problem are discussed in detail. As an approach to optimal reservoir design, the author uses operational hydrology to estimate system performance and benefit functions. An algorithm for optimal operation of a reservoir with deterministic flow is developed. Decision theory is then applied to operational hydrology to generate storage-yield functions. Case studies are cited to illustrate the efficiency of the operational hydrology and simulation in the design of water resource systems. The reservoir-storage-yield function establishes operational hydrology as an important tool in simulation as well as design. (Siegenthaler-Rutgers)

ALGAECIDAL EVALUATION AND ENVIRONMENTAL STUDY OF MAT PRODUCING BLUEGREEN ALGAE,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Naman E. Otto.
Available from NTIS as PB-194 808, $3.00 in paper copy, $0.95 in microfiche. Bur of Reclam Report REC-OCE-70-25, June 1970. 27 p, 13 fig, 7 tab, 27 ref.

Descriptors: *Algae, *Aquatic weeds, *Weed control, Growth, *Cultures, *Algicides, Bibliographies, *Ecology, Aquatic life, Irrigation systems, Water analysis, Temperature, Limnology, Cyanophyta, Irrigation canals, Algal control.
Identifiers: *Algae culture technique, Aquatic weed study facility, Product evaluation, Blue-green algae.

Algaecidal tests of 74 compounds showed that only 9 were more active than copper sulfate, and one provided total control of the blue-green algae mat colonies. Results of preliminary algaecidal field tests with copper sulfate and admixtures of enhance activity are given. Observations of algaecidal treatments on an irrigation canal suggest that copper sulfate applications of 0.48 lb/cfs applied every 2 wk suppressed blue-green mat growth. Water temperature appears critical to treatment success. Results of studies conducted in 1967-1969 to determine environmental parameters of irrigation canals are presented. Data show that mat-type, blue-green algae grow in a wide range of water quality and temperature conditions and do not require enriched conditions for growth. Coloration substances in the water may influence the availability of micronutrient metals and may stimulate directly blue-green algae growth.

CANAL CAPACITY STUDIES MAIN CANAL COLUMBIA BASIN PROJECT,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Mansil W. Scrivner.
Available from NTIS as PB-196 741, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Report REC-OCE-70-31, July 1970. 128 p, 7 fig, 6 tab.

Descriptors: Canals, *Roughness coefficient, Open channel flow, *Flow resistance, *Analysis, Rigid linings, Trapezoidal channels, *Mannings equation, *Head loss, *Algae, Reaches (Distance), Horizontal curves, Research and development, Field data, Subcritical flow, Hydraulics, Chemicals, Washington, Fluctuation, Water surface, Field tests, *Hydraulic properties, Aquatic weeds.
Identifiers: Concrete linings, Main Canal, CBP, Wash, Columbia Basin Proj, Wash.

Additional tests were made during 1965, 1966, and 1967 on the Long Lake Reach of the Main Canal, Columbia Basin Project, to determine the hydraulic properties of the canal and the effect of aquatic growths during these years. Test methods and observation locations were the same as the 1963-64 studies. Filamentous algae growth was light to moderate and generally much below that observed during prior seasons. Fresh water sponge infestation was reported to be increasing. Flow resistance improvement after treatment of the canal with copper sulfate was not as great as had been anticipated. Two weeks after treatment, flow resistance returned to about pretreatment values.

FLOOD PLAIN INFORMATION, KINGFISHER AND UNCLE JOHN'S CREEKS, KINGFISHER, OKLAHOMA.
Corps of Engineers, Tulsa, Okla.

Corps of Engineers Flood Plain Report, January 1971. 35 p, 7 fig, 16 plate, 11 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *Oklahoma, Regional flood, Flood forecasting, Flood control, Peak discharge, Rainfall-runoff relationships, Historic flood.
Identifiers: *Kingfisher (Okla), Standard project flood, Intermediate regional flood.

Flooding along Kingfisher and Uncle John's Creeks in the vicinity of Kingfisher, Oklahoma is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections and other material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The greatest flood known to have occurred during recent history on Kingfisher and Uncle John's Creeks, occurred in June 1948. Although this flood did not produce the highest water elevations in some parts of Kingfisher, the discharge was greater than any other known flood on both creeks. Another great flood, in September 1961, was the second largest flood. The discharge was slightly less than the June 1948 flood. (Woodard-USGS)

In: Frontiers in Conservation, Proceedings 24th Annual Meeting Soil Conservation Society of America, August 10-13, 1969, Colorado State University, Fort Collins, p 145-149, 1970. 5 p, 1 fig, 1 tab, 6 ref.

Descriptors: *Flood plains, *Flood damage, *Flood control, *Floods, *Flood plain zoning, Flood protection, Building codes, Abatement, Check structures, Drainage systems, Multiple-purpose projects, Water management (Applied), Colorado.

Floods cause over a billion dollars damage a year in the United States, and the damage is increasing in spite of an annual federal investment of over $500 million. Widespread storms over eastern Colorado in June 1965 caused more than $500 million damage; 21 people lost their lives. Unfortunately, the people living in the floodplain were probably unaware of the hazard under which they lived. No doubt they are now convinced that floodplain settlement should be regulated by zoning or that flood control structures should be built before people settle in floodplains. But then it would be difficult to justify them, and so a cycle of settlement, flood damage, and building costly control structures continues. One can see the tremendous need for multicounty organizations to properly plan and zone land not yet developed and to provide rights-of-way for control structures before their cost becomes ex-

cessive. Floodplains can be put to many uses other than residential, business, and industrial development. These include (1) greenbelts, (2) development of natural resources, (3) recreation, (4) highways, and (5) permissible occupation. (See also W71-06129) (Woodard-USGS)

THE DESCHUTES RIVER HYDROGRAPH FORECAST,
Soil Conservation Service, Portland, Oreg.
Tommy A. George.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 68-73, 1970. 6 p, 9 plate, 1 tab, 4 ref.

Descriptors: *Streamflow forecasting, *Hydrograph analysis, *Oregon, Water management (Applied), Snowmelt, Water rights, Regression analysis, Irrigation water.
Identifiers: *Deschutes River (Oreg).

This paper explains the procedure used to forecast critical flow levels and the dates that these levels will occur on the Deschutes River at Bend, Oregon. The value of the forecast to water users in relation to their water rights, and the problems involved in reconstructing the streamflow hydrograph used in deriving the forecast equations are discussed. Examples of forecasted versus actual hydrographs for the past several years are included. The information is used by the watermaster and irrigation districts in managing the river and their water use. (See also W71-06133) (Knapp-USGS)

Available from NTIS as PB-198 129, $3.00 in paper copy, $0.95 in microfiche. Reprint, American Society of Agricultural Engineers, St Joseph, Michigan 49085, Paper 70-582, 1970. 17 p, 12 fig, 30 ref. OWRR Project B-018-WIS (2).

Descriptors: *Harvesting of algae, *Aquatic weed control, *Mechanical control, *Dewatering.
Identifiers: Farm machinery, Industrial machinery, Utilization, Modification.

Selective mechanical harvesting of undesirable aquatic vegetation appears to be a feasible and ecologically sound approach to control in recreational waters. The transportation from the harvest area to the disposal site is a major expense in the overall harvest operation. Since aquatic vegetation is approximately 90 per cent water processing and dewatering this material as a part of the initial harvesting operation greatly facilitates its transportation and ultimate disposal or utilization. Intensive mechanical dewatering based on procedures developed in this research results in reducing the fibrous fraction of aquatic vegetation to 16 per cent of its original volume and 32 per cent of its original weight, while removing from the harvested area 90 per cent of the original dry matter, 85 per cent of the protein, 60 per cent of the potassium, and 80 per cent of the phosphorus present in the growing vegetation. The reduction in fiber length resulting from the dewatering process increases the ease with which the vegetative material can be transferred through conveying systems thus further facilitating handling and disposal. The major portion of the equipment required for the preprocessing and dewatering can be developed by utilization and modification of components of all readily available farm and industrial machinery.

**STUDIES ON THE CHEMICAL CONTROL
TREE ROOTS IN SEWER LINES,**
O. A. Leonard, and Neal Townley.
Paper presented at the Calif WPCA 42nd Ann
Conference, Sacramento, Calif, April 29 to May
1970.

Descriptors: *Sewers, *Laboratory tests, *Ro
systems.
Identifiers: *Tree roots, Sewer hydraulics.

This study was a cooperative effort by the auth
and Dr. Ahrens of the Connecticut Agricultural E
periment Station. The problem was studied
Davis and the Utilities Division of Sacramento
growing wood plants in pots filled with a potti
mix which were placed on open cans. Roots whi
grew into cans were treated for periods of time
solutions of different chemicals. The most prom
ing treatments were examined in a single test
July 1969 in the sewer lines of Sacramento Coun
All treatments were effective in killing the roots
the lines but some were more effective than oth
in killing roots in and outside of joints. Studies a
being continued to evaluate factors influencing k
cost, and safety to trees.

ies may be purchased from Bureau of Publicas, Tenth and Market Streets, Harrisburg, Penn. 25. Pennsylvania Geological Survey Fourth Se- Bulletin W-27, 1970. 96 p, 12 fig, 2 plate, 14 23 ref.

criptors: *Water resources, *Groundwater, nnsylvania, *Hydrologic data, *Data collecs, Water wells, Hydrogeology, Geology, ifers, Aquifer characteristics, Water yield, cific capacity, Water quality, Chemical analy- Topography, Water utilization, Consumptive Meteorology, Evaluation, Water resources elopment, Hydrology, Maps.
tifiers: *South-central Pennsylvania, *Groundr resources, Test holes, Well logs.

Loysville and Mifflintown quadrangles include rea of about 460 square miles of valley and e terrain in south-central Pennsylvania. This is underlain by strongly folded sedimentary s that consist chiefly of sandstone, siltstone, e, and limestone of Ordovician, Silurian, and onian age. Yields reported for more than 500 s ranged from less than 1 gpm to 275 gpm; the ian yield was 12 gpm. Fewer than 5% of the s were reported to yield more than 50 gpm, and r than 3% were reported to yield less than 1 . Evaluation of reported-yield data, specificcity data, and borehole-flow data from the est wells inventoried indicate that the prin- yielding zones generally occur above a depth out 200 feet. Water from calcareous shales imestones generally has a dissolved-solids con- of 200 to 300 mg/liter and the water is rally hard to very hard. Water from the nonreous shales, siltstone, and sandstones rally has a total dissolved-solids content of 100 0 mg/liter, and is generally soft to moderately (Woodard-USGS)

,940-square-mile area covered by this study es in the southwestern part of the Great Basin ada and encompasses 13 valleys. Altitudes in ea range from 4,370 feet on the floor of s Salt Marsh Valley to 13,140 feet at the f Boundary Peak. Precipitation averages 3-6 at the lower altitudes and 20 inches or more highest mountain areas. The growing season on a minimum temperature of 28 deg F) e 170-200 days on the lower valley floors, ss than 100-150 days at higher altitudes. The quantitative hydrologic character of each valley is summarized. Wells yield groundwater solely from the alluvium at depths that generally range from 30 to 300 feet. Groundwater withdrawals are minor (less than 5-10 acre-feet per year) in all but eastern Soda Spring Valley, where they are about 30 acre-feet per year. The chemical character of water in the report area is highly variable, even within a single valley. Groundwater in Columbus and Rhodes Salt Marsh Valleys is the least suitable for domestic and agricultural use, wheras most water in the other valleys is generally acceptable. In some places, excessive fluoride is or may be a problem for domestic use. (Woodard-USGS)

SEVENTH BIENNIAL CONFERENCE ON GROUNDWATER (PROGRESS, PRACTICE, AND POTENTIAL OF GROUNDWATER RECHARGE, DEVELOPMENT AND MANAGEMENT).

Copies available from Univ. of California, Water Resources Center, Los Angeles, Calif. 90024 - Price $3.00 each. Proceedings 7th Biennial Conference on Groundwater, held at University of California, Los Angeles, September 10-11, 1969: Los Angeles, California University Water Resources Center Report No 18, 1970. 235 p, append.

Descriptors: *Groundwater, *Water supply, *Conferences, *California, Water yield, Water resources development, Water demand, Water utilization, Aquifers, Water wells, Pumping, Water costs, Conjunctive use.
Identifiers: *University of California at Los Angeles.

These conference proceedings included presentations and panel discussions of technical papers pertaining to groundwater hydrology. Topics include progress on the Institutional front; progress on the technical front; new approaches and techniques; framework of the future; and needs of the future. Papers related to new approaches and techniques emphasize streamflow augmentation by groundwater utilization. This has already been operated in the Thames River Basin in England and the Great Miami River Basin in Ohio (U.S.A.). Pertinent information of water balance, water demand, water yield, and water costs is included. (See also W71-06118) (Woodard-USGS)
W71-06117

POTENTIAL FOR STREAMFLOW AUGMENTATION BY GROUNDWATER PUMPING,
Miami Conservancy District, Dayton, Ohio.
Richard F. Thomas.
In: Proceedings 7th Biennial Conference on Groundwater, held at University of California, Los Angeles, September 10-11, 1969: Los Angeles, California University Water Resources Center Report No 18, p 73-92, 1970. 20 p, 3 fig, 2 tab, 5 ref.

Descriptors: *Conjunctive use, *Water resources development, Ohio, *Low-flow augmentation, *Groundwater, Water yield, Water demand, Water utilization, Water costs, Aquifers, Pumping, Water wells, Water supply, Streamflow.
Identifiers: *Streamflow augmentation, *Great Miami River Basin (Ohio).

The characteristics of the potential groundwater augmentation scheme for the Great Miami River in Ohio include: (a) An average annual demand of about 30,000 acre-feet; (b) a one in 10-year demand of 64,500 acre-feet; (c) one in 10-year pumping rate of 280 cfs with a nearly linear distribution from 1 to the maximum rate for the critical period of 280 days; (d) Well field containing 92 wells; and (e) Wells 18 inches in diameter, 150 feet deep, and 500-foot apart. Preliminary estimates of cost of the groundwater pumping scheme are $3.5 to $5 million. A comparable surface reservoir would cost a minimum of $30 million. In the Great Miami River Basin glacial outwash deposits form the best aquifers. Outwash deposits fill the buried valleys to a thickness of 100 to 250 feet in the main valleys and to generally less than 100 feet in the tributary valleys. Individual wells near a stream can yield up to 3,000 gallons per minute, while wells not receiving induced recharge yield 500 to 1,000 gpm. Total water storage in the buried valley system along the Great Miami, the Stillwater and Mad Rivers is approximately 6,500,000 acre-feet. (See also W71-06117) (WOoodard-USGS)

ARTIFICIAL RECHARGE PRACTICES IN HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
David R. Hargis, and Frank L. Peterson.
Available from NTIS as PB-198 233, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 43, October 1970. 36 p, 4 tab, 9 fig, 22 ref. OWRR Project A-028-HI (1).

Descriptors: *Hawaii, *Artificial recharge, Groundwater, Water spreading, Wells, Shafts (Excavations), Irrigation, Cesspool, Seepage, Ditch, Pit recharge.
Identifiers: Ditch leakage.

Artificial recharge practices in Hawaii include stream-water recharge through wells and shafts, storm drainage disposal through wells and pits, induced leakage from ditches and reservoirs and deliberate spreading of excess irrigation water, incidental ditch and reservoir leakage and other nondeliberate recharge of irrigation water, and cesspool seepage. The most significant source of artificial recharge to groundwater bodies in Hawaii is probably recharge incidental to irrigation. Deliberate artificial recharge to groundwater bodies consists of wells recharging stream water at Hanapepe, Kanuai and Puukapu, Hawaii, wells and pits which dispose of storm drainage at Wailuku and Kahului, Maui and Hilo, Hawaii, and excess irrigation water by induced leakage from ditches and reservoirs and water spreading over fields and in gulches at Hawaiian Commercial and Sugar Company on the East Maui isthmus. In addition, the Department of Land and Natural Resources of the State of Hawaii will begin disposal of treated sewage through three deep wells at Waimanalo, Oahu as soon as sewerage is completed.

AN ECONOMIC ANALYSIS OF THE INTERTEMPORAL ALLOCATION OF GROUNDWATER IN THE CENTRAL OGALLALA FORMATION,
Oklahoma State Univ., Dept. of Agricultural Economics.
Solomon Bekure.
Ph.D. Dissertation, May 1971. 227 p, 5 fig, 56 tab, 28 ref, 7 append. OWRR Project A-010-OKLA (1)

Descriptors: *Allocation, *Models, Crop production, Water table, Groundwater, Withdrawal, Linear programming, *Economic impact, *Natural resources, *Water utilization, Resource allocation, *Water supply
Identifiers: *Intertemporal allocation, Well yield, Ogallala formation

This dissertation is concerned with the investigation of the intertemporal allocation of groundwater in the Central Ogallala Formation. The major objective of this study is to present estimates of (1) the growth of irrigation in the study area and (2) the rate of depletion of the aquifer over time and its effects on (a) the pattern of irrigated crop production and (b) the gross and net receipts to irrigated crop production over time. Two recursive linear programming models were employed to depict the pattern of irrigated crop production over the period 1965-2070. A multi-stage sequential decision model was developed and the dynamic programming technique was used in order to determine the optimal allocation of groundwater over a planning horizon of 100 years. Assumptions, models and input data were presented. Results of each model and comparisons of the results were discussed. It indicated that irrigators in the study area will not misallocate the groundwater resource for discount rates other than zero by Model I. But Model II showed that the population of the area should be concerned about uneconomic mining of groundwater after 1990. (Wang-Rutgers)

ULATION OF RUNOFF FROM URBAN TERSHEDS,
h Water Research Lab., Logan.
. Dhruva Narayana, J. Paul Riley, and Eugene sraelsen.
ter Resources Bulletin, Vol 7, No 1, p 54-68, ruary 1971. 6 fig, 5 tab, 5 ref.

criptors: *Urbanization, *Runoff, *Simulation lysis, *Analytic techniques, Mathematical lels, Hydrograph analysis.
tifiers: *Urban watersheds, *Urban hydrology, tiple regression analysis, Urban hydrologic lels.

nathematical model for urban watersheds is g developed in stages at the Utah Water earch Laboratory, Utah State University at an. In verifying the watershed as a unit, ershed coefficients are determined on the com-r, and related to the urbanization charac-tics. The second stage of verification consists viding the watershed into subzones, and deter-ng the urban parameters within each subzone. n subzone is then individually modeled, and low hydrographs are routed through succeed-downstream subzones to the gaging point. The el thus makes it possible to: (a) develop runoff els for subzone hydrographs within the urban rshed, and (b) account for spatial variations of n and watershed characteristics. An attempt also made to analytically model the outflow ograph based on storm and watershed charac-tics. (Davis-Chicago)

riptors: *Revegetation, *Brush control, ge grasses, *Soil-plant-water relationships, er-shed management, Arizona, Reclamation, erosion, Creosote, Mesquite, Soil moisture, lands, Rainfall, Cultivation, Crop production, texture, Distribution, Land management, s, Research and development, Mechanical ol.

Identifiers: *San Simon watershed (Arizona), *Lehmann lovegrass, Semi-arid lands, Chaining, Pitting.

Reclamation of the eroded and frail San Simon watershed (Southeastern Arizona) is based on revegetation. Mechanical shrub control of creosotebush and sand-dune mesquite increases available soil moisture to native range grasses. Grass-reseeding and shrub-control studies were conducted to evaluate an optimum response balance under hot semi-arid conditions. There was no emergence of Lehmann lovegrass until summer rainstorms, regardless of planting time or spring rains. Lovegrass is required tillage to yield, though chaining and pitting showed promise. Soil moisture and texture are discussed for grass yields. Precipitation distribution in time and amount is the key to effective land management. Of the 9.5 inches of annual rainfall, 58% (5.5 inches) occur randomly during the summer growing season. Plowed seedbeds of Lehmann lovegrass produce the most dependable yield. Research is continuing on effective plowing methods, seedbed manipulation through different pits, fungicide treatment of seeds, seed germination, selection and development of adopted grasses, and other factors useful in managing semiarid wildland. PINYON-JUNIPER CONTROL: WHERE. WHY,
Arizona Univ., Tucson. Dept. of Watershed Management; and Arizona Univ., Tucson. Dept. of Range Management.
J. T. O'Rourke, and P. R. Ogden.
Progressive Agriculture in Arizona, Vol 22, No 6, Nov-Dec 1970, p 12-15. 1 tab, 3 fig.

Descriptors: *Juniper trees, *Pinyon pine trees, *Revegetation, *Erosion control, *Brush control, Watershed management, Soil textures, Phosphates, Neutralization, Calcium carbonate, Crop production, Marketing, Forages, Soil, Precipitation, Vegetation, Grazing, New Mexico, Arizona, Nevada, California.
Identifiers: *Wood products.

A discontinuous belt of pinyon-juniper (P-J) is found through New Mexico, Arizona, Nevada and California. Grazing in this belt is delicately balanced with P-J so that P-J control must be successfully conducted to minimize erosion. The object of this study is to measure precipitation, soil and vegetation characteristics to determine the influence of each on production and density of forages planted after P-J control. Four study sites in northern Arizona were selected. P-J control is recommended where there is a market for wood-products removed, in areas of high P-J density, high precipitation, low calcium carbonate, near neutral pH, high available phosphates, and medium-textured soils. Care in extrapolation of data to other areas is recommended. Soil-water-plant relationships are basic to P-J control. (Popkin-Arizona)

TREATMENT OF ACID MINE DRAINAGE BY OZONE OXIDATION,
Brookhaven National Lab., Upton, N.Y.
M. Beller, C. Waide, and M. Steinberg.
Copy available from GPO Sup Doc as WQO Report 14010FMH, Dec, 1970, $1.00; microfiche from NTIS as PB-198 225, $0.95. Environmental Protection Agency-W20 Report 14010FMH, Dec 1970. 91 p, 23 fig, 28 tab, 40 ref. EPA-WQO Contract No 14-12-838.

Descriptors: *Mine Drainage, *Iron oxides, *Ozone, Industrial wastes, Neutralization, Limestones, Iron, Costs, Treatment, Waste water treatment, Oxidation.
Identifiers: Ferrous iron, Ferric iron.

An engineering design and economic study to evaluate the feasibility of ozone oxidation and limestone neutralization of Acid Mine Drainage (AMD) was performed. The study concludes that an ozone process is feasible, compares economically with existing processes, and offers potential advantages in process control, reduced neutralization costs, and simplified AMD sludge handling and disposal. Ozone production by electric discharge and radiation processes are compared both for on-site and central plant installations utilizing ozone shipping and storage facilities. A central chemonuclear ozone production plant with a distribution system is found to be most economical, followed by electric discharge central and on-site plants. Design and construction of a mobile pilot plant which employs electric discharge ozonizers is recommended for field trials of the process.

ALL YOU SEE IS THE STREAM,
H. S. Hulme, Jr.
Am City, Vol 85, No 3, p 77-78, Mar 1970.

Descriptors: *Drainage systems, *Stream improvement.
Identifiers: Swales, Storm sewers, Arlington County, Virginia.

A controlled stream was constructed above a reinforced-concrete storm sewer enclosing Pimmet Run in Arlington County, Va. to prevent erosion upstream while retaining the aesthetic value of the stream downstream. Swales created along the stream carry local drainage and overflow from storms into the main culvert. Methods of construction and problems encountered are explained. Dimensions and costs of the system are included.

STRUCTURES PREVENT URBAN SEDIMENT DAMAGE,
Stephen M. Boysen.
Public Works, Vol 100, No 8, p 116-117, Aug 1969. 3 fig.

Descriptors: *Design, *Construction, *Settling basins, *Storm runoff, Performance, Operations research, Sediment control.

District of Columbia area engineers and the USCA Soil Conservation Service jointly worked to improve sediment basin design. These basins prevent damages originating from soils disturbed by intensive construction. Their purpose is to trap eroding soil and keep it on or near its original site while earth-movers do grading for new developments. These structures are temporary, but they protect stream-channels, impoundments, roads, etc. from damaging sediment. A typical sediment basin holds ponded runoff from which soil particles settle as water passes slowly into a vertical drain shortly after a heavy rain. Details regarding construction and performance are discussed. The fundamental design problem of striking a balance between detention time and economical basin size is also explored. Effectiveness of these basins is proven by the increasing number of counties employing the structures in the metropolitan Washington and Baltimore areas.

POLLUTION FROM MINES IN THE 'NEW LEAD BELT' OF SOUTH EASTERN MISSOURI,
Missouri Univ., Rolla. Dept. of Environmental Health; and Missouri Univ., Rolla. Dept. of Geochemistry.
Bobby G. Wixson, Ernst A. Bolter, Nicholas H. Tibbs, and Anthony R. Handler.
Available from NTIS as PB-198 042, $3.00 in paper copy, $0.95 in microfiche. Paper presented at the 24th Annual Purdue Industrial Waste Conference, May 7, 1969. 25 p, 9 fig, 1 tab, 16 ref. OWRR Projects A-021-MO (2) and B-021-MO (3).

Descriptors: *Water pollution sources, *Mine wastes, *Heavy metals, *Mining, *Missouri, Copper, Surface waters, Streams, Water quality, Methodology, Chemical analysis, Mine water, Ecology, Fish, Pollutant identification.
Identifiers: *Lead mining (Mo), Zinc.

In the southeastern part of Missouri, the Clark National Forest straddles the Ozark Plateau and contains the headwaters of some of the most scenic rivers in the state. In 1955, rich mineral deposits were discovered in this area and by 1962 a rich lead-zinc ore belt was found to extend for approximately thirty-six miles almost due south from Viburnum, Missouri, through Iron and Reynolds Counties. The name given this new ore district was the Viburnum Trend or the 'New Lead Belt'. This study for this report is concerned with the change of water quality and ecology of streams receiving the mining wastes. Heavy metal studies indicated that the range of values for copper, lead and zinc were from 1-20 ppb (parts per billion). The most frequently occurring values for all 3 elements were from 4-6 ppb. No significant changes in water quality were found for dissolved oxygen, alkalinity, hardness or stream temperature. Recommendations are presented for future stream pollution abatement in the 'New Lead Belt'. (See also W71-04182) (Woodard-USGS)

RADIOCHEMICAL ANALYSES OF WATER FROM SELECTED STREAMS, WELLS, SPRINGS, AND PRECIPITATION COLLECTED PRIOR TO REENTRY DRILLING, PROJECT RULISON,
Geological Survey, Denver, Colo.
Paul T. Voegeli, Sr., and Hans C. Claassen.
Prepared for Nevada Operations Office, US Atomic Energy Comm. Geological Survey Open-file Report USGS-474-83 (Rulison-6), 1971. 16 p, 1 fig, 4 tab, 2 ref. USAEC Agreement No AT (29-2)-474

Descriptors: *Radiochemical analysis, *Surface waters, *Groundwater, *Colorado, *Data collections, Radioactivity, Tritium, Uranium radioisotopes, Solubility, Sampling, Methodology, Chemical analysis, Investigations, Laboratory tests, Test procedures, Water analysis, Streams, Lakes, Hydrologic data, Equations.
Identifiers: Gross alpha radioactivity, Gross beta radioactivity.

The U.S. Geological Survey established a water sampling network in central and western Colorado on behalf of the U.S. Atomic Energy Commission to sample the hydrologic environment prior to and during the reentry drilling and the gas-production test phase of Project Rulison, an experiment to stimulate gas production from a low yield reservoir by a nuclear explosion. Samples obtained from selected streams, wells, springs, and from precipitation are analyzed for tritium, gross alpha, and gross beta activity. The analyses are made in laboratories of the U.S. Geological Survey, Denver, Colorado. This report contains data from analyses of samples from the network collected prior to reentry drilling (started April 28, 1970), including sample data obtained both prior to and after the nuclear detonation. The data are intended to give representative values over approximately a 1-year period and to show variations in natural radioactivity. (Woodard-USGS)
W71-05842

INVESTIGATIONS OF DAILY VARIATIONS IN CHEMICAL BACTERIOLOGICAL AND BIOLOGICAL PARAMETERS AT TWO LAKE ONTARIO LOCATIONS NEAR TORONTO, PART I--CHEMISTRY,
Ontario Water Resources Commission, Rexdale.
T. G. Brydges.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 750-759, 1969. 10 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Lake Ontario, *Water quality, *Monitoring, Bacteria, Water chemistry, Phosphorus, Nitrogen, Ammonia, Algae, Nutrients, Sewage, Waste water (Pollution), Water pollution sources, Municipal wastes, Great Lakes, *Pollutant identification.
Identifiers: *Toronto (Ontario).

An investigation of daily variations in chemical, bacteriological and algal parameters was carried out using samples collected five days a week from Toronto Harbour and from the intake of the R. C. Harris Filtration Plant. The intake extends 2500 m from shore and is 12 m deep in 23 m of water. The study began in July 1968. Weekly depth and sediment samples were collected to supplement the daily data. Fourteen chemical parameters were monitored. Total phosphorus concentration was the best indicator of the presence of urban drainage. Ammonia and organic nitrogen concentrations in the harbor vary inversely; consequently Kjeldahl nitrogen is a better measure of water quality than either of them. Surface nitrate concentrations vary with wind speed and biological activity and do not always reflect the effects of runoff. Chlorophyll and soluble phosphorus concentrations in the harbor vary inversely. Phosphorus was apparently not limiting algal growth, but there were insufficient data to test the relationship for the open lake. Daily data were required to define some inter-parameter relationships which were not defined by data collected at weekly intervals. (See also W71-05561) (Knapp-USGS)
W71-05879

TRACE ELEMENTS IN LAKE ERIE,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
V. K. Chawla, and Y. K. Chau.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 760-765, 1969. 6 p, 4 fig, 2 tab, 10 ref.

Descriptors: *Water chemistry, *Trace elements, *Lake Erie, Distribution patterns, Copper, Iron, Sampling, Data collections, Great Lakes, Lakes, Variability, Water quality, *Pollutant identification.
Identifiers: Lead, Zinc, Lithium, Nickel.

The data on trace elements obtained from cruises during the period June to October 1967 Lake Erie were examined to study their concent tions and distributions both horizontally and ve cally. Of the 11 elements studied, the concent tions of cadmium, chromium and cobalt w below the detection limits. The annual aver values of iron, manganese, strontium and copper surface waters were comparatively higher than average of some fresh water lakes of North Am ica. Concentrations of zinc, nickel, lithium and le were quite comparable. The horizontal distril tions of copper, zinc, nickel, lithium and lead w uniform in the main water body of the weste central and eastern basins. Iron and mangan were higher in the western and central than eastern basins, however, strontium on the contr was lower in the western basin. (See also W7 05561) (Knapp-USGS)
W71-05880

SOME VARIATION IN THE QUALITY WATER FROM THE SOURCE AND MOUTH THE NIAGARA RIVER,
State Univ. of New York, Buffalo. Dept. of Biolo
Thomas H. Sibley, and K. M. Stewart.
In: Proceedings Twelfth Conference on Gr Lakes Research, May 5-7, 1969, University Michigan, Ann Arbor: International Associati for Great Lakes Research, p 774-785, 1969. 12 p fig, 1 tab, 30 ref.

Descriptors: *Lake Ontario, *Lake Erie, *Wa quality, *Water pollution sources, Hardn (Water), Potassium, Sodium, Chlorides, Dissolv oxygen, Hydrogen ion concentration, Alkalini Water temperature, Great Lakes, Magnesiu Streamflow, Solutes, Path of pollutants, Water p lution effects.
Identifiers: *Niagara River.

An investigation in 1967 and early 1968 compar similarities and differences in selected variables water quality from the source and mouth of t Niagara River. The source of the River is the lar volume discharge from Lake Erie and the mouth the point at which this discharge empties into La Ontario. Industrial and municipal wastes and so runoff from agricultural areas are discharged in the river along portions of Western New Yo (USA) and Ontario (Canada). Comparisons we made of temperature, dissolved, oxygen, pH, har ness, alkalinity, calcium, magnesium, sodiu potassium, chlorides, total residue, fixed solids a conductivity. Chlorides and conductivity were co tinuously higher at the mouth. The mean values all parameters, except total residue and fixe solids, were slightly higher at the mouth. Althou the increases were relatively slight, the discharg from Lake Erie is so great that even slight chang in water quality between the source and mou represent impressive inputs into the river. DISSOLVED MINERAL QUALITY OF GREA LAKES WATERS,
Department of Energy, Mines and Resource Burlington (Ontario). Canada Center for Inlan Waters.
R. R. Weiler, and V. K. Chawla.
In: Proceedings Twelfth Conference on Grea Lakes Research, May 5-7, 1969, University o Michigan, Ann Arbor: International Associatio for Great Lakes Research, p 801-818, 1969. 18 p, fig, 5 tab, 15 ref.

Descriptors: *Water quality, *Water chemistry *Water pollution sources, *Great Lakes, Trace ele ments, Solutes, Chlorides, Calcium, Magnesium Sodium, Potassium, Sulfates, Bicarbonates Fluorine, Sampling, Industrial wastes, Lake Superi or, Lake Huron, Lake Erie, Lake Ontario, Monitor ing, Data collections, Path of pollutants.
Identifiers: *Water quality monitoring.

In 1968 the Canada Center for Inland Waters (C-CIW) undertook a systematic monitoring of Lakes Ontario, Erie, Huron and Superior in a study of the major (Ca, Mg, Na, K, SO4, Cl, HCO3 and F) and trace (Zn, Cu, Pb, Fe, Ni, Cr, Mn and Sr) elements. The data gathered on major elements during the period July to November 1968 were examined and the results compared on a lake-wide basis with earlier compilations to appraise recent trends and changes in the composition of these waters. Because the concentrations of all major ions for which data are available in Lake Superior have not changed for the last 70-80 years, their levels are apparently controlled by the balance between the amount of dissolved substances added by runoff from the drainage basin and that lost through St. Mary's River. Chloride and sulphate have increased in Lakes Michigan and Huron. This increase is most likely caused by human activities. In Lakes Erie and Ontario, all the major ions except bicarbonate and magnesium have shown a dramatic increase since 1910. Previous to that, the Lakes were essentially unaffected by human activities. The median values of minor elements (except-ng Sr) is generally below 10 micrograms/liter in he Great Lakes. Sorption by oxides of manganese nd iron and by suspended organic and inorganic naterial seems a plausible mechanism for the emoval of minor elements from the lakes. (See lso W71-05561) (Knapp-USGS)

ALUATION OF AN AUTOMATIC CHEMI-L ANALYSIS MONITOR FOR WATER ALITY PARAMETERS,
w York State Dept. of Health, Albany. Div. of s and Research.
es E. O'Brien, and Rolf A. Olsen.

Journal Water Pollution Control Federation, Vol 42, No 3, Part 1, p 380-390, 1970. 7 fig, 3 tab, 4 ref.

Descriptors: *Monitoring, *Water quality, *Chemical analysis, Data collections, Control systems, Measurement, Colorometry, Automatic control, Data processing, New York.
Identifiers: *CSM-12, Hudson River (NY).

The effectiveness was evaluated of a monitor to collect samples from a continuously pumped stream representative of surface water and analyze them automatically on a continuous or intermittent basis for 12 specific parameters of water quality; and to evaluate the equipment when used in conjunction with an electronic data processing system and computer. After over a year's usage it was concluded the particular equipment was not satisfactory for the designed purpose for the following reasons: No provision is made within the analytical system to compensate for interference of color and suspended matter in determining certain parameters. No satisfactory method was provided to prevent or compensate for baseline drift and, in the absence of computer control, there could be no external compensation. Mechanical and electrical solenoid valve failure prevented acceptable results for five months; their replacements also failed. No practical method was provided to prevent algae and slime growths. Friction-fitting connectors frequently failed; leakage required cleaning operations. Without extensive instrument modification correcting these deficiencies, it would be futile to evaluate the equipment in conjunction with an electronic data processing system and computer. (Jones-Wisconsin)

HEAVY METAL POLLUTION: POLICY AND PROGRAM IMPLICATIONS FOR THE PROTECTION OF THE ECOSYSTEM,
Department of Fisheries and Forestry, Ottawa (Ontario).
K. C. Lucas.
Presented at Special Symposium on 'Mercury and Man's Environment', February 15 and 16, 1971, Royal Society of Canada, Ottawa. Typescript, 12 p.

Descriptors: *Heavy metals, *Toxicity, *Public health, Environmental engineering, Water pollution, Fish, Mining, Industrial wastes, Iron.
Identifiers: *Mercury, Mercury pollution, Acceptable daily intake, Metal effects.

Three levels of toxicity of heavy metals can be distinguished. The heavy metals discharged into the environment are persistent, essentially indestructible elements. Some of the trace metals are necessary nutrients for the well being of organisms. Others are toxic. Little synergism has been found between heavy metals at the low concentrations. Means of controlling heavy metals pollution are discussed from the point of view of governmental agencies. The control program of Canada is outlined. The major program implications of the problem of control of heavy metal pollution are in the areas of regulation, monitoring and research. (Novotny-Vanderbilt)

ACTIVITIES OF THE FOOD AND AGRICULTURE ORGANIZATION AND THE WORLD HEALTH ORGANIZATION REGARDING MERCURY,
Department of National Health and Welfare, Ottawa (Ontario).
D. G. Chapman.
Presented at Symposium on 'Mercury and Man's Environment', February 15 and 16, 1971, Royal Society of Canada, Ottawa. Typescript, 7 p.

Descriptors: *Heavy metals, *Toxicity, *Human pathology, Metals, Inorganic compounds, Organic compounds, Environmental engineering, Fish, Food chains, Foods.
Identifiers: *Mercury, Acceptable daily intake, Mercury pollution, Organic mercury.

The effort of the international organizations, the Food and Agriculture Organization, and the World Health Organization, to define and establish an acceptable daily intake for mercury and a tolerance for mercury on food products is discussed in the paper. It was suggested that the background levels (practical residue limits) of mercury in foods amount to 0.02 to 0.05 ppm. Officially the two agencies of the United Nations have not found it possible to establish an acceptable daily intake for mercury and hence have not recommended tolerances for mercury in food. AN INTERFEROMETRIC TECHNIQUE FOR TEMPERATURE AND CONCENTRATION MEASUREMENT FOR AN AIR-WATER INTERFACE,
Virginia Univ., Charlottesville.
C. Prasad, C. S. Chen, and J. T. Beard.
Journal of Basic Engineering, Transaction ASME, Paper No 70-WA, Temp-1, 1970. 6 p.

Descriptors: *Heat transfer, *Mass transfer, *Measurement, *Instrumentation, Temperature, Temperature control, Air-water interfaces, Boundary processes, Evaporation, Convection, Diffusion.
Identifiers: Temperature measurement, Mass transfer measurement.

A new technique for the measurement of temperature and concentration for a simultaneous heat and mass transfer analysis is described. The technique employs a one wavelength Mach-Zehnder interferometer with an additional noninterferometric measurement of temperature or concentration. This overcomes the difficulties encountered in other interferometric techniques used for simultaneous heat and mass transfer analysis such as two wavelength technique and one wavelength technique with the assumption of Lewis number being unity. Computational formulas were developed by which either temperature or concentration can be calculated from the interferograms. An air-vapor boundary layer formed due to heated water and ambient air sent in parallel flow was analyzed with this technique. Better results in the air-water system were obtained for the concentration from interferogram analysis with the temperature measured by another technique. (Novotny-Vanderbilt)

THE FACTS BEHIND THE MERCURY,
James T. Parker.
Popular Science, p 62-63, December 1970.

Descriptors: *Heavy metals, *Water pollution, *Path of pollutants, Toxicity, Public health, Fish, Environmental engineering, Water pollution effects, Bottom sediments, Aquatic microorganisms, Pollutant identification, Chemical wastes.
Identifiers: Metals effects, Mercury, Mercury pollution, Organic mercury.

In 1969, Canadian authorities discovered mercury levels of 10 ppm in fish from Lake St. Clair and the Lake Erie region. The maximum level in food deemed safe for human consumption is 0.5 ppm and in water 0.5 ppb. The mercury present is in form of methyl-mercury which is 100 times more toxic than metalic mercury. The mechanism of transferring metalic mercury into its organic form is a complex process accomplished by the action of microorganisms in bottom sediments and rotten fish. The length of active life of mercury-contaminated sediments in lakes and rivers is not known. About 78,000 flasks of mercury of 76 pounds each were consumed in the United States in 1969 with 26% used by factories making chlorine

and caustic soda. The technique of detecting mercury is discussed. (Novotny-Vanderbilt)
W71-06100

DEVELOPMENT OF AN INSTRUMENT FOR MEASURING THE CONCENTRATION OF DISSOLVED OXYGEN IN SEA WATER IN SITU,
Hawaii Inst. of Geophysics, Honolulu.
Volker Grafe.
Available from NTIS as PB-196 145, $3.00 in paper copy, $0.95 in microfiche. Report HIG-70-29, November 1970. 20 p, 9 fig, 6 ref. WSF Grant No GA-779.
Identifiers: *Sea water, Oxygen, *Dissolved gases, Measurement, Accuracy, Ocean bottom, Telemetering equipment, Digital systems, Oxygen sensors.

An instrument is described consisting of a commercially available oxygen sensor and of a newly developed telemetering and digitizing system which permits measurement of the concentration of dissolved oxygen even in great oceanic depths. The instrument employs a frequency modulation telemetry scheme and is compatible in its frequency range and its power requirements with the Bisset-Berman TDS-recorder. The accuracy of the instrument is determined by the accuracy of the oxygen sensor.
W71-06104

WATER QUALITY OF THE DELAWARE RIVER ESTUARY, JULY THROUGH DECEMBER 1967,
Geological Survey, Washington, D.C.

Geological Survey open-file report 1970. 84 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Water quality, *Delaware River, *Estuaries, *Hydrologic data, *Data collections, Chemical analysis, Tides, Tidal waters, Sampling, Boats, Chemical properties, Salinity, Dissolved solids, Dissolved oxygen, Water chemistry, Biological properties.
Identifiers: Analytical data (Tables).

Samples collected from the Delaware river were taken three feet below the water surface at the center of the navigation channel by boat at 17 selected stations extending from Reedy Island, Del., to Fieldsboro, N. J., about 6 miles below the head of tide at Trenton, N. J. Sampling runs were made at approximately weekly intervals. For each run, the boat began at the farthest downstream station and proceeded upstream. Samples were collected at each station at slack tide. About two-thirds of the runs were made at low-water slack and the remainder at high-water slack. Samples were analyzed for over 30 water-quality parameters. Tables present the analytical data obtained during the first 6 months of the program, covering the last half of 1967. The data were retrieved and printed out by computer. Four tables are presented for each station--two tables of analytical results and two of statistical summaries. Maximum observed chloride concentrations ranged from 15 to 20 mg/liter above river mile 110, increasing to 50 mg/liter between river miles 85 and 90, and to 7,500 mg/liter at river mile 55. During the summer season dissolved oxygen concentrations ranged from a maximum of 9 mg/liter to a minimum of less than 1 mg/liter. The higher values were observed in the upper and lower portions of the Estuary and the lowest values were observed in the reach between river miles 70 and 100. (Woodard-USGS)

A PORTABLE MULTIPARAMETER WATER QUALITY KIT,
Geological Survey, Menlo Park, Calif.
Keith V. Slack.
Journal Water Pollution Control Federation, Vol 42, No 7, p 1395-1399, July 1970. 5 p, 3 fig, 2 ref.

Descriptors: *Water quality, *On-site tests, *Water analyses, Instrumentation, Sampling, Testing, Hydrogen ion concentration, Dissolved oxygen, Electrical conductance, Water temperature.
Identifiers: *Field water-analysis kit.

A kit was assembled from commercial units for instrumental measurement of four water quality properties on grab samples or in situ in streams and shallow lakes. The water quality kit consists of an instrument package and an accessory package. The instrument package contains all equipment needed for measurements of temperature, pH, DO, and specific conductance on water samples or at near-surface depths. The accessory package contains supplies and equipment for several supplementary quality determinations and extends the capability of temperature, DO, and conductance measurements to depths of 35 m. A device is included for taking water samples from the surface to depths of at least 15 to 20 m. The compact size of the equipment is well suited to field use or to transporting as luggage on commercial carriers. The cost will vary with the particular models used, but in the present example was about $750 for the instrument package and $100 for the accessory package. (Knapp-USGS)
W71-06157

WATER QUALITY AT THE DADE-COLLIER TRAINING AND TRANSITION AIRPORT, MIAMI INTERNATIONAL AIRPORT, AND COTTONMOUTH CAMP-EVERGLADES NATIONAL PARK, FLORIDA, NOVEMBER, 1969,
Geological Survey, Tallahassee, Fla.
Benjamin F. McPherson.
Geological Survey open-file report No 70011, 1970. 29 p, 2 fig, 9 tab, 7 ref.

Descriptors: *Water pollution sources, *Airports, *Florida, *Urbanization, Pesticides, Oily water, Solutes, Nitrogen, Phosphorus, Organic matter, Heavy metals, Path of pollutants, Water pollution effects.
Identifiers: *Everglades, *Miami (Fla).

Water quality was determined at three areas in south Florida in November 1969 to compare conditions at a commercial jetport (Miami International Airport), and in a natural environment (Cottonmouth Camp in Everglades National Park) and a transitional environment (Dade-Collier Training and Transition Airport). Water in canals near Miami International Airport generally contained more nitrogen, phosphorus, organic carbon, trace elements and heavy metals, and less dissolved oxygen than waters at the other areas. Concentrations of chromium, lead, and oil in surface water at Miami International Airport exceeded the limits established by the Federal Water Quality Administration; concentrations were below these limits in the other areas. Sediment at Miami International Airport was heavily coated with oil and grease (23%) at station 5, and contained 85.2 micrograms per kg on the DDT family at station 1. Sediment at other stations contained less than 3.0% oil and grease and less than 4.2 micrograms/kg of the DDT family. (Knapp-USGS)

MAYFLY DISTRIBUTION AS A WATER QUALITY INDEX,
Winona State Coll., Minn.
Calvin R. Fremling.
Copy available from GPO Sup Doc as No 16030 DQH, Nov 15, 1970, $0.50; microfiche from NTIS as PB-198 223, $0.95. EPA-WQO Final Report No 16030 DQH, Nov 15, 1970. 39 p, 18 fig, 54 ref. WP00987.

Descriptors: Mayflies, Water quality, Indicators, Water pollution effects, Mississippi River.
Identifiers: Hexagenia, Pentagenia.

Three species of burrowing mayflies (Hexagenia bilineata, Hexagenia limbata, and Pentagenia vittigera) are sufficiently abundant to cause nuisance problems along portions of the Mississippi River. Mayfly distribution, as determined by collections made by ship captains and other cooperators over a 13-year period, has proven to be an excellent index of general water quality on a river which is so large that is cannot be monitored effectively or economically by standard methods. Pollutants have severely reduced the numbers of all three species for 30 miles below Minneapolis, Minnesota, and for over 300 miles below St. Louis, Missouri. P. vittigera is able to emerge only in early and late summer in the St. Louis area when cool water temperatures lessen toxic effects in the zone of degradation. Impoundment and enrichment of the Upper Mississippi River has temporarily increased the carrying capacity of the river for H. bilineata which now dominates areas formerly dominated by H. limbata. The total productivity of the Upper Mississippi is being reduced by pollution, man's encroachment into the flood plain and by the filling of navigation pools by sand. Methods have been developed to rear large numbers of Hexagenia nymphs in the laboratory. Bioassay tests utilizing artificial, burrow-containing substrates reveal that H. bilineata nymphs can survive anaerobic conditions for as long as 11 hours. TLm values for hydrogen sulfide varied from 0.42 ppm at 48 hr to 0.17 ppm at 96 hr. Of several heavy metals (Cr, Ni, Zn, Cu) tested, copper was the most toxic to H. bilineata nymphs. TLm values for copper ranged from 0.54 ppm at 12 hr to 0.22 ppm at 48 hr.

CHARACTERIZATION OF OIL SLICKS ON SURFACE WATERS,
Federal Water Quality Administration, Cincinnati, Ohio. Analytical Quality Control Lab.
F. K. Kawahara, and D. G. Ballinger.
Industrial and Engineering Chemistry, Product Research and Development Quarterly, Vol 9, No 4, p 553-558, 1970. EPA-WQO Project 1602.

Descriptors: *Infra-red, *Radiation, *Oil wastes, *Oily water, *Asphalt, Absorption, Pollution identification.

Ratios of infrared absorption from unidentified petroleum pollutants are compared with those from industrial asphalts and residual fuel oils. Asphalts, No. 6 fuel oils, No. 5 fuel oils, and lubricating oils were characterized. Supplemental analyses - API gravity, solubility behavior, distillates - supplement the initital classification by the RIA technique. (Kawahara-EPA/WQO)

AN ELECTRODE CHAMBER FOR RECORDING RESPIRATORY AND OTHER MOVEMENTS OF FREE-SWIMMING ANIMALS,
National Water Quality Lab., Duluth, Minn.

W. A. Spoor, T. W. Neiheisel, and R. A. Drummond.
Trans Amer Fisheries Soc Vol 100, No 1, p 22-28, 1970. 5 fig, 19 ref. Project No 18050 WAE 01/71, Grant No WP-01317-01.

Descriptors: *Fish behavior, *Fish physiology, *Electronic equipment, Remote sensing, Water pollution effects, Aquatic invertebrates, Laboratory equipment, Laboratory animals.
Identifiers: *Electrode chamber, Electrode design.

The occurrence of potential differences in the microvolt range between stainless steel electrodes immersed in water at opposite ends of an animal chamber can be related clearly to respiratory and other movements of animals moving freely in the water. The differences are attributed to the effects of water currents on the equilibrium potentials of the electrodes. The chamber can be large or small, according to the size of the animal. Changes over the biological range in such variables as temperature, dissolved oxygen concentration, free carbon dioxide and pH do not interfere; neither do metals in dilute solution, or non-electrolytes. Inorganic salts affect electrode sensitivity, but not seriously in fresh water, and the method can be made to work in sea water.

WATER CHEMISTRY OF TOXAPHENE - ROLE OF LAKE SEDIMENTS,
Wisconsin Univ., Madison. Water Chemistry Lab.
Gilman D. Veith, and G. Fred Lee.
Environmental Science and Technology, Vol 5, No , p 230-234, March 1971. 5 p, 1 fig, 4 tab, 20 ref.

Descriptors: *Path of pollutants, *Bottom sediments, *Pesticides, *Chlorinated hydrocarbon pesticides, Mixing, Leaching, Laboratory tests, Clay minerals, Water chemistry, Biodegradation.
Identifiers: *Toxaphene.

The role of lake sediments in the detoxification of lakes which were treated with toxaphene was evaluated under environmental and laboratory conditions. The extent of toxaphene accumulation in sediments of three Wisconsin lakes was determined by electron capture gas chromatographic analysis of core sections and Ekman dredge samples. The toxaphene concentration in the 0 to 5-cm level of the sediment increased for 190 days following the treatment of the lakes and then began decreasing by a factor of 2 every 120 days. Toxaphene was transported vertically to the 5 to 10-cm and the 10 to 15-cm level of the sediment at rates varying from 0.4 to 1.1 cm per day in the three lakes. Toxaphene was not detected below the 20-cm level of the sediments. Toxaphene which was sorbed onto the sediment in the lake could not be leached from the sediment by lake water under laboratory conditions. (Knapp-USGS)

MERCURY USES IN CANADA AND THEIR POSSIBLE HAZARDS AS SOURCES OF MERCURY CONTAMINATION,
University of Western Ontario, London. Dept. of Zoology.
Norvald Fimreite.
Financed by contract with Canadian Wildlife Service. Environmental Pollution, Vol 1, No 2, p 119-131, October 1970. 13 p, 4 fig, 1 tab, 38 ref.

Descriptors: *Water pollution sources, *Surface waters, *Heavy metals, *Industrial wastes, Inorganic compounds, Streams, Lakes, Aquatic habitats, Fishkill, Wildlife, Birds, Ecology, Environmental effects, Soils, Plants, Industrial production, Chlorine, Seeds, Poisons, Water pollution effects.
Identifiers: *Mercury, *Mercury contamination (Canada).

During the past ten years mercury consumption has shown a strong upward trend in Canada. The major proportion of this increase can be accounted for by the chloralkali industry, from which nearly 200,000 lbs of mercury are released into the environment each year. Most of this mercury finds its way to watercourses exposing aquatic ecosystems where mercury is known to accumulate. The use of mercury compounds for slime control in the Canadian pulp industry is decreasing, but in one case elevated mercury levels in fish were traced back to such a source. Also decreasing is the use of seed-dressings containing mercury, although this use of mercurials is still considerable, and in view of findings in other countries elevated mercury levels in seed-eating birds and their predators must be expected. Elevated levels of mercury were found in pheasants and partridges collected in Southern Alberta where mercury seed-dressings are extensively used. (Woodard-USGS)
W71-05861

DIFFUSION FROM A CONTINUOUS SOURCE IN A UNIFORM SHEAR FLOW,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Akira Okubo, and Michael J. Karweit.
Limnology and Oceanography, Vol 14, No 4, p 514-520, July 1969. 7 p, 5 fig, 16 ref. USAEC Contract AT (30-1)-3109; ONR Contract Nonr 4010 (11).

Descriptors: *Diffusion, *Dispersion, *Mixing, *Path of pollutants, Flow, Diffusivity, Non-uniform flow, Turbulant flow, Shear, Mathematical models.
Identifiers: *Shear flow.

The importance of velocity shear in the diffusion of a patch of passive contaminant from an instantaneous source is well recognized. Shear also plays an important role in the spread of contaminant from a continuous source. A model for the diffusion of a dynamically passive contaminant from a continous source is presented. This source is superposed on a mean flow with uniform shear. An equation is derived which shows by numerical solution that the maximum concentration of the contaminant in the resulting plume decreases nearly as the reciprocal of the distance. Small and large time approximations verify this result analytically. The skewness of the concentration distribution at various distances from the source is also analyzed. This diffusion model compares favorably with diffusion experiments conducted in seas and lakes. (Knapp-USGS)

SURFACE WATER INPUTS OF IODINE, BROMINE, AND CHLORINE TO LAKE HURON,
Michigan Univ., Ann Arbor. Dept. of Meteorology and Oceanography; and Michigan Univ., Ann Arbor. Great Lakes Research Div.
Mary A. Tiffany, and John W. Winchester.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 789-800, 1969. 11 p, 3 fig, 10 tab, 12 ref, 2 append. AEC Contract AT (11-1)-1705.

Descriptors: *Water pollution sources, *Lake Huron, *Halogens, *Great Lakes, Chlorine, Chlorides, Path of pollutants, Water balance, Salinity, Industrial wastes.
Identifiers: Bromine, Iodine, Saginaw River.

Surface waters were systematically sampled and analyzed for chlorine, bromine, and iodine by neutron activation for material balance calculation of inputs and outflows for Lake Huron. Saginaw River basin samples (42) from autumn 1968 showed marked halogen pollution, also detected in 11 Saginaw Bay samples. River water from 16 northern Michigan and Ontario locations was less polluted. Using these and previously published analyses, together with available rainfall and river discharge data, total input/outflow ratios for Lake Huron are: Cl, 1.04; Br, 1.73; I, 1.15. Cl and I are apparently near a steady state, but inflow of Br significantly exceeds outflow. If present inputs continue, the Br concentration will rise in Lake Huron, but Cl and I will remain roughly constant. Reducing Saginaw River halogen pollution, which supplies nearly half the Cl and Br input, should decrease Lake Huron Cl concentration and arrest the increase of Br concentration. PLANKTON REDUCTION IN THE REVERSED FLOW WATERWAYS OF THE METROPOLITAN SANITARY DISTRICT OF GREATER CHICAGO,
Metropolitan Sanitary District of Greater Chicago, Ill.
Norman W. Youngsteadt.
Metropolitan Sanitary District of Greater Chicago, April 25, 1969. 32 p, 14 fig, 4 tab, 5 ref.

Descriptors: *Plankton, *Phytoplankton, *Water pollution, *Monitoring, *Water quality control, Sewage effluents, Waste water, Water analysis, Sampling, Illinois.
Identifiers: *Chicago.

A preliminary survey of the plankton of the reversed-flow waterways of the District, made in 1967, revealed a reduction in plankton concentration upon traveling downstream from the Lake Michigan inlets. At that time, it was thought the decrease in expected plankton concentrations could have resulted from death due to pollution, and the phenomenon of decreasing concentrations of plankton might thus be used to establish an index to the relative degree of pollution in the reversed flow waterways. A system of sampling was established and plankton was collected from the District's reversed flow waterways on October 14 and 15, 1968. Plankton were found to be reduced in concentration between Lake Michigan inlets and downstream portions to a greater extent than could be accounted for due to additions of non-plankton bearing water. Reduction patterns corresponded closely to those noted for samples collected in October of the previous year. It was concluded that these reductions were likely due to poor water quality conditions and that if water quality improved, future sampling would reveal a lesser degree of plankton reduction. The effectiveness of plankton reduction as a monitor of water quality will become known when pollution control measures are taken and pollution is reduced. If plankton reduction is simultaneously reduced, the method will be proved and development into a reliable tool for estimating relative water quality will be at hand. (Poertner)

GENESEE COUNTY ENVIRONMENTAL HEALTH, CONCLUSIONS REPORT, GENESEE COUNTY, MICHIGAN.
Genesee County Metropolitan Planning Commission, Flint, Mich.; and Battelle Memorial Inst., Columbus, Ohio.

Copies of report are available from: Genesee County Metropolitan Planning Comm., Flint, Mich.; and HUD Regional Office Library, 306 N. Michigan Ave., Chicago, Illinois 60601. Genesee County Metropolitan Planning Commission, Flint, Michigan, February 1970. 159 p, 15 fig, 73 ref. HUD Project No Mich P-155.

Descriptors: *Water pollution, *Water pollution sources, *Urbanization, *Water quality control, *Land use, *Water pollution control, Soil erosion, Waste water treatment, Sewerage, Public health, Environmental engineering, Michigan.
Identifiers: *Genesee County, *Flint, Environmental health.

This report examines the current status of pollution in the air, soil, and water sectors of the environment of Genesee County. Current and future programs at the federal, state, and local levels, and existing facilities are evaluated in terms of adequacy in controlling and preventing pollution problems found to be present in the three sectors of the environment. In addition to recommendations and conclusions on existing and proposed legislation and programs and existing facilities, the report contains recommendations regarding the relationship of land use planning to control and prevention of environmental pollution Genesee County to 1990. It was concluded that there is considerable water pollution in the county, particularly in the Flint River and tributaries entering in the City of Flint. Control of pollution requires, above all, construction and improvement of waste collection and treatment facilities to keep waste discharges at a level not detrimental to desired uses of the water. Prime factors contributing to water pollution include poor drainage, gentle channel slopes, low oxygen reaeration in streams, and the presence of swamps. Of all water pollution alternatives, direct treatment of waste discharges is presently the only effective means available within feasible cost limits. (See also W71-05933) (Poertner)

DISTRIBUTION OF TRACE METALS IN IMPOUNDMENTS,
Arkansas Univ., Fayetteville Resources Research Center.
J. Nix.
Available from NTIS as PB-198 089, $3.00 in paper copy, $0.95 in microfiche. Arkansas Water Resources Research Center, Fayetteville, Publication No 6, January 1970. 194 p, 31 tab, 71 fig, 44 ref. OWRR Project B-002-ARK (2).

Descriptors: Water quality, *Trace elements, Reservoir, *Impoundments Arkansas, *Metals, Heavy metals, Iron, Copper, Cobalt, Lead, Chromium, Water pollution sources.
Identifiers: *Ouachita River (Ark), *Trace metals, Zinc, Nickel.

An investigation of the trace element content of two impoundments on the Ouachita River, Arkansas, was conducted. Common water quality parameters were followed in the reservoirs in an effort to determine the factors which were influencing the trace element concentration. The following trace metals were determined in both the particulate phase (retained by a 0.45 micron filter) and the soluble phase (passed by a 0.45 micron filter): iron, manganese, copper, cobalt, nickel, lead, chromium, and zinc. These measurements were made periodically for one and a half years. Results indicate that the chemical regime of the impoundments which were studied was greatly influenced by the cool water releases from an upstream impoundment. A cold density current throughout the entire main stem of the reservoir furnished dissolved oxygen to the lower portion of the impoundments and prevented the accumulation of large quantities of iron and manganese. More typical hypolimnic conditions were observed in the sidepockets of the reservoir. Data suggest that outside of hypolimnic zones in the reservoir, soluble iron is present in very small quantities, usually less than 10 ppb.

POLLUTION - ARE FERTILIZERS AT FAULT,
Maryland Univ., College Park. Dept. of Soils.
Fred P. Miller.
Crops and Soils Magazine, p 15-30, September 1970. 8 fig.

Descriptors: *Water pollution sources, *Fertilizers, *Agriculture, Nitrogen, Phosphorus, Nutrients, Runoff, Nitrification, Minnesota.
Identifiers: Potomac River (DC), Fort Wayne (Ind).

A comparison of non-farm contribution to water pollution indicates agriculture's share as neither alarmingly large nor, in many areas, important. Farm fertilizers do not appear to be the major contributors; most phosphates fed into the Mississippi River through sediments, are native to the soil itself and not the result of fertilization. Probably the greatest concern is the nitrogen loss from animal wastes. Most of the nutrients draining from farmlands accrue from these wastes and from spreading manure on frozen ground. Under recommended fertilization programs, the bulk of data seems to indicate that nitrogen losses through leaching are not significant on most cultivated soils and, generally, are much less than 10-20% of that applied. The present evaluation does not indicate that fertilizer usage is in serious violation of the ecological balance. Natural nitrification processes in the soil and nitrification of sewage effluent and animal wastes seem to be the major contributors to nitrates in groundwater. Many of Minnesota's eutrophied lakes are in areas completely isolated from agricultural watersheds. The case against fertilizers appears to have been overstated by many. (Jones-Wisconsin)

MAN-MADE SOURCES OF MERCURY,
National Swedish Environment Protection Board, Stockholm.
Arne Hanson.
Presented at Symposium on 'Mercury and Man's Environment', February 15 and 16, 1971, Royal Society of Canada, Ottawa. Typescript, 20 p.

Descriptors: *Heavy metals, *Water pollution, *Industrial wastes, Metals, Water pollution effects, Catalysts, Inorganic compounds, Pulp and Paper Industry, Public health, Environmental engineering, Chemical wastes, Agricultural chemicals, Food, Food chains.
Identifiers: Mercury pollution, Sources of mercury.

In Sweden today, the commercial harvesting of fish has been prohibited in more than sixty water areas due to the high level of mercury in fish. The sources of mercury are apparatus and instruments, manufacture of mercury compounds, the chlor-alkali industry, catalysts, dental use, recovery and purification of mercury, the paint industry, the pulp and paper industry, agricultural use, raw materials, and basic chemicals. The forms and compounds of mercury wasted from these processes are described. The following measures are recommended: prohibition of mercury use or restriction, changing or improving processing techniques, and improved water and air purification techniques. Approximately 500 tons of mercury have been deposited in the bottom sediments of Swedish waters. It is believed that the recycling of mercury from bottom sediments will be a major water pollution problem in the future. (Novotny-Vanderbilt)

THERMAL DISCHARGE: A MODEL - PROTOTYPE COMPARISON,
Pacific Gas and Electric Co., Emeryville, Calif. Engineering Research Dept.
R. M. Miner, P. D. Hindley, and R. F. Cayot.
ASCE National Water Resources Engineering Meeting, Phoenix, Arizona, Jan 11-16, 1971. 40 p, 20 fig, 1 tab.

Descriptors: *Thermal pollution, *Water temperature, *Model studies, *Prototypes, *Estuaries, Mixing, Instrumentation, Tides.
Identifiers: Thermal discharge, Infrared sensing.

Receiving water temperature distributions resulting from the thermal discharge of Pacific Gas and Electric Company's existing Pittsburg power plant, which is located on the San Francisco Bay tidal estuary, have been measured for several years. Both conventional and infrared temperature acquisition techniques have been used. It was desired to compare these distributions with those obtained by simulating the thermal discharge on the San Francisco Bay-Delta Model, which is operated by the Corps of Engineers. The photographs presented show that the model accurately reproduces the general features of the prototype cooling water discharge. Both qualitative and quantitative results indicate that the distorted model used in this case was capable of reproducing the relevant prototype processes with an accuracy sufficient for the study of a power plant thermal discharge problem. The differences between model and prototype results are due to certain limitations in the experimental procedures, and the inherent randomness of a turbulent mixing process. (Upadhyaya-Vanderbilt)
W71-06095

A STUDY OF THE BEHAVIOR OF OIL SPILLS IN THE ARCTIC,
Coast Guard, Washington, D.C. Applied Technology Div.
John L. Glaeser, and George P. Vance.
Available from NTIS as AD-717 142, $3.00 in paper copy, $0.95 in microfiche. Final Report, Feb 1971. 60 p, 18 fig, 3 tab, 6 ref. Project No 714108/A/001,002.
Identifiers: *Water pollution, *Oils, *Arctic regions, Water pollution, Petroleum, Combustion, Removal, Control, Ice, Aging (Materials), Adsorption, Sraw, Wind, Viscosity, *Oil pollution, Abatement, *Water pollution control.

A program to investigate the behavior of oil spills in the Arctic was conducted off the northern coast of Alaska in July 1970. Numerous small oil spills were made to obtain data on the following subjects: the spreading behavior of crude oil on ice and water surfaces; the interaction characteristics of crude oil with ice; the aging characteristics of crude oil which has been spilled on ice, on water, and under ice; and the effectiveness of burning and absorption as methods of removal. Both Prudhoe Bay ('Sag River) crude oil and diesel fuel were used in the test program. Results quantify spreading and interaction characteristics in addition to presenting qualitative information on each area of interest. Promise is shown for both burning and absorption as methods of oil removal in the summer. Data is presented on both the physical and chemical characteristics of aged crude oil.

SPECIAL STUDIES OF A SANITARY LANDFILL,
University of Southern California, Los Angeles.
Robert C. Merz, and Ralph Stone.
Available from NTIS as PB-196 148, $3.00 in paper copy, $0.95 in microfiche. Final Summary Report, 1970. 217 p, 15 fig, 21 tab. PHS Grant No UI-00518-08.
Identifiers: *Earth fills, *Refuse disposal, *Garbage disposal, Earth fills, *Sanitary engineering, Earth fills, Waste disposal, Aeration, Percolation, Anaerobic conditions, Aerobic processes, Gases, Compacting, Field tests, Rainfall intensity, Climate setting, *Sanitary landfills, *Solid waste disposal.

Model sanitary landfill cells were constructed and, over a 4.. year period, subjected to simulated environmental conditions such as added water, aeration, and aerobic and anaerobic operation. The effect of these conditions on percolation, gas quality and production, settlement, and temperature was measured. Examination of core samples taken at the end of the study period showed that refuse in the aerated cell was well decomposed except for plastics and other inerts and that refuse in the anaerobic cells was easily identifiable. Based on an original cell depth of 20 feet, volume reduction in the aerated cell was 21.5% and in the anaerobic cells, 11.5%. The four parts of this report detail the activity during the last year of the project and summarize the data collected for the span of the project (1/1/64 to 12/31/68).

PROBLEMS OF POLLUTION OF IRRIGATION WATERS IN ARID REGIONS,
Utah State Univ., Logan, Dept. of Agricultural and Irrigation Engineering; and Robert S. Kerr Water Research Center, Ada, Okla.
H. B. Peterson, A. A. Bishop, and J. P. Law, Jr.
In: Water Quality Management Problems in Arid Regions, Federal Water Quality Administration Water Pollution Control Research Series 13030 DYY 6/69, p 17-36, October 1970. 20 p, 3 fig, 4 tab, 27 ref.

Descriptors: *Irrigation water, *Water pollution sources, *Irrigation, *Arid climates, Surface waters, Groundwater, Irrigation effects, Agriculture, Agricultural chemicals, Saline water, Wastes, Evaporation, Water pollution sources, Water conservation, Sediments, Soil-water-plant relationships, Nutrients, Irrigation practices.

The climate in arid regions is conductive to high evapotranspiration losses and a minimum of natural leaching. For intensive crop production, irrigation is necessary. Irrigated soils of the United States are scattered throughout, but the major areas are in the 17 western states. Within these, the areas most adversely affected by salt in the irrigation return flow are those in the lower reaches of the larger river systems of southwestern United States; those areas in the Lower Basin of the Colorado River, the Gila and Salt Rivers of Arizona, the Rio Grande in New Mexico and Texas, the San Joaquin River in California, and similar streams. In all of these river basins, there is a progressive deterioration in water quality as it flows downstream. Different pollutants have very diverse and changing effects on the value of water. Salts generally decrease the value more or less in proportion to the concentration increase; however, there are broad critical ranges where the user is forced to change the type of crop, and then there may be a sharper value decline for a given increment of salt. This can continue until at some concentration the water can no longer be used for irrigation and must be disposed of or treated. (See also W71-06111) (Woodard-USGS)
W71-06112

NATURAL POLLUTION IN ARID LAND WATERS,
Utah State Univ., Logan. Ecology Center.
John M. Neuhold.
In: Water Quality Management Problems in Arid Regions, Federal Water Quality Administration Water Pollution Control Research Series, 13030 DYY 6/69, p 79-84, October 1970. 6 p, 2 ref.

Descriptors: *Water pollution, *Arid lands, *Surface waters, *Water pollution sources, Streams, Streamflow, Geology, Vegetation, Evaporation, Topography, Runoff, Precipitation (Atmospheric), Sediment transport, Water quality, Turbidity, Dissolved solids, Geochemistry, Evaluation.
Identifiers: *Natural water pollution.

This report explores the meaning of natural pollution in an arid lands surface-water system, generalizes a definition for this pollution and speculates on the possible consequences of the pollution thus defined. During periods of precipitation, the surface flow is usually loaded with relatively high concentrations of particulate matter which increases the corrosive quality of the water, and its turbidity. High evaporative losses result in a concentration of solids dissolved from the geological formations making up the watershed and the silt loads carried by the runoff. Most definitions agree that pollution implies a change in quality as a result of man's use. Similarly, the term natural can be variously defined. It can include or exclude the influence of man. Two approaches to natural pollution considering man are that first, man is considered part of an ecosystem which he can manipulate but only to the limit of available resources or to levels of limiting factors before collapse of the system results. What affects the system affects him. In the second approach, man sets himself apart from the system. He manipulates it to maximize his immediate economic gain. In the first, and ecological ethic of land and water use is inherent. In the second, it is nonexistent. (See also W71-06111) (Woodard-USGS)
W71-06113

ANIMAL WASTE RUNOFF--A MAJOR WATER QUALITY CHALLENGE,
Federal Water Quality Administration, Kansas City, Mo. Missouri Basin Region.
Anthony V. Resnik, and John M. Rademacher.
In: Water Quality Management Problems in Arid Regions, Federal Water Quality Administration Water Pollution Control Research Series 13030 DYY 6/69, p 95-105, October 1970. 11 p, 25 ref.

Descriptors: *Water pollution sources, *Livestock, *Wastes, *Surface waters, *Groundwater, Cattle, Hogs, Sheep, Seepage, Runoff, Streams, Lakes, Streamflow, Organic wastes, Biochemical oxygen demand, Water quality, Nitrates, Abatement, Planning, Water pollution control.
Identifiers: *Feedlots.

Animal wastes contaminate water supplies, destroy fish and aquatic life in streams, and generally degrade water quality. More important, it is also known that animal wastes are a controllable major source of water pollution necessitating immediate attention. Since feedlots have generally been located without regard to the soil inventory and topographic characteristics, surface runoff to streams with subsequent damage from high BOD wastes is common. Infiltration of nitrates from manures to well waters is documented. Sixty-six thousand feedlots, ranging in capacity up to 100,000 animals blanket 7 to the 10 Missouri Basin States. Animal wastes from the more than 20 million cattle, 16 million swine and 7 million sheep defecate wastes equivalent to 370 million people. The human population of the Missouri Basin Region is 7.9 million. Assuming that 5% of the animal waste enters the streams, the calculated stream pollution from animal wastes in the basin is more than twice the human population equivalent. The extent of the problem as well as the effects on surface and groundwaters are illustrated with research data. The present status of legislation in regulatory control of pollution is discussed. Measures to strengthen present regulations are proposed. (See also W71-06111) (Woodard-USGS)
W71-06114

NITRATE POLLUTION OF WATER,
Illinois State Water Survey, Urbana.
Julius H. Dawes, Thurston E. Larson, and Robert H. Harmeson.
In: Frontiers In Conservation, Proceedings 24th Annual Meeting Soil Conservation Society of America, August 10-13, 1969, Colorado State University, Fort Collins, p 94-102, 1970. 9 p, 8 fig, 6 tab, 6 ref.

Descriptors: *Water pollution sources, *Groundwater, *Surface waters, *Nitrogen compounds, Illinois, Hydrologic cycle, Fertilizers, Industrial wastes, Decomposing organic matter, Organic wastes, Domestic wastes, Livestock, Precipitation (Atmospheric), Water quality, Chemical analysis, Soils, Soil water, Seepage, Sorption, Crops, Nitrates.

Nitrogen levels in surface waters that exceed established standards are evidence of mans intrusion in the environment and the cause of deterioration in water quality. Thirty-nine million tons of chemical fertilizers were applied in the United States in 1967, of which approximately 6 million tons was nitrogen. In Illinois about 25% of all water samples from wells 50 feet deep or less have been found to contain an excessive concentration of nitrate, that is, above the 45 milligrams per liter level. The sources of nitrogen in Illinois surface and subsurface waters are varied and often difficult to identify. Known sources of pollution include precipitation, human wastes, crop residues, decomposing animal or plant tissue, industrial wastes, and nitrogen fertilizer. At the present time there is no

known practical and economical way of recovering these excess nitrates. Membrane techniques and biological methods both have potential for preventing pollution of water by nutrients, salts, and minerals, whether the source is fertilizer, irrigation water, sewage, or industrial wastes. THE MONOCACY RIVER-PHYSICAL, CHEMICAL AND BACTERIOLOGICAL WATER QUALITY REPORT NUMBER 1, MARCH-DECEMBER 1966,
Maryland Dept. of Water Resources, Baltimore. Div. of Water Quality Investigations.
Charles R. De Rose.
Maryland Division of Water Quality Investigations Report, December 1967. 108 p, 16 fig, 11 tab, 20 ref, 2 append.

Descriptors: *Water pollution sources, *Rivers, *Water quality, *Maryland, *Data collections, Domestic wastes, Industrial wastes, Land use, Chemical analysis, Streamflow, Discharge measurement, Runoff, Sampling, Coliforms, Dissolved oxygen, Biochemical oxygen demand, Water temperature, Methodology, Nitrates, Phosphates, Color, Dissolved solids.
Identifiers: *Monocacy River basin (Md).

During 1966, water quality of the Monocacy River was determined from 21 stations located in the 58-mile section of the Maryland portion of the river from the mouth to the Pennsylvania State line. Sixteen major tributaries were included with stations located near the mouths of the streams. Additional stations were located on 6 streams to study the effect of sewage treatment plant discharges. Water quality was studied and compared with criteria for dissolved oxygen, biochemical oxygen demand (B.O.D.), pH, and coliform bacteria. Wide variations in stream flow occurred frequently and affected the water quality. The water quality in the middle section of the Monocacy River, which included a 22-mile section of river above the Frederick City sewage treatment plant discharge, was generally good. Minimum dissolved oxygen concentrations remained at about 5.0 ppm. Of the 16 major tributaries studied, Carroll Creek was found to be severely polluted and a large contributor to the pollution load borne by the Monocacy River. (Woodard-USGS)
W71-06176

MONTHLY VARIATION IN PHOSPHATE AND RELATED CHEMICALS FOUND IN THE SEDIMENT IN THE ISLAND AREA OF LAKE ERIE, 1967-68, WITH REFERENCE TO SAMPLES COLLECTED IN 1964, 1965, and 1966,
Ohio State Univ., Columbus. Water Resources Center
N. Wilson Britt, and Edwin J. Skoch.
Available from NTIS as PB-198 128, $3.00 in paper copy, $0.95 in microfiche. Ohio Water Resources Center Project Completion Report No 333X, 1970. 30 p, 3 tab, 6 fig, 33 ref. OWRR Project A-008-OHIO (2).

Descriptors: *Lake Erie, *Phosphorous, *Iron, *Eutrophication, Great Lakes, Mud-water interfaces, Dissolved oxygen, Water pollution sources.
Identifiers: *Bottom sampling, *Sediment analysis, Substrate, Organic carbon, Oxygen consumed.

Samples of sediment collected in 1964, 1965, 1966, and on a monthly basis from May 1967 through November 1968, were analyzed for total phosphate, iron and organic carbon. Samples were collected by means of a core technique developed by E. J. Skoch. The cores were sectioned at 2.5 cm intervals and each of the six sections was analyzed for the same factor. Results of the analyses showed only a slight increase in phosphate since 1964. However, all those factors showed a definite increase from May 1967 through November 1968. The two sampling methods yielded slightly different results. The sediment was found to consist of two distinct layers, with the upper 5 cm of sediment being usually higher in concentrations of materials than the lower portion.

POLLUTION, BY BIOSYNTHESIS 'IN SITU' OF CARCINOGENOUS HYDROCARBONS, OF A LAGOON BIOCENOSIS 'IN VITRO' REPRODUCTION OF THIS PHENOMENON (IN FRENCH),
Centre de Recherches du Service de Sante des Armees, Paris (France). Division de Biologie Generale et Ecologie.
P. Niaussat.
French and English Summaries. Revue Internationale D'Oceanographie Medicale, Vol 17, p 87-98, 1970. 4 tab, 20 ref.

Descriptors: *Oil, *Anaerobic bacteria, *Phytoplankton, Water pollution sources.
Identifiers: Biosynthesis, Biocenosis, Benxo-3-4-Pyrene.

A hydro-biological investigation of marine biocenosis in the isolated lagoon of Clipperton indicated that in a natural environment with an absence of industrial pollution biosynthesis of some carcinogenous hydrocarbons, particularly benzo-3-4-pyrene, is possible. This hypothesis was confirmed by experimentation. In mixed cultures of marine phytoplankton and bacteria, growing rate of benzo-3-4-pyrene was demonstrated in terms of time culture. The interruption of bacterial growth by utilization of antibiotics stabilizes the increase of this hydrocarbon's rate. (Ensign-PAI)

AERIAL PHOTOGRAPHIC TRACING OF PULP MILL EFFLUENT IN MARINE WATERS,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
Fred J. Burgess, and Wesley P. James.
Copy available from GPO Sup Doc as I67.13/4: 12040EBY 08/70, $1.25; microfiche from NTIS as PB-198 232, $0.95. EPA-WQO Report 12040 EBY August 1970. 152 p, 11 tab, 68 fig, 20 ref, 6 append. EPA-WQO Grant WP-00524.

Descriptors: *Pulp and paper industry, *Waste water disposal, *Remote sensing, *Aerial photography, Industrial waste, Sewage effluents, Oceans, Coasts, Outlets, Mixing, Diffusion, Currents (Water), Bioassay, Temperature, Water pollution sources, Path of pollutant.

Aerial photography taken of waste plumes from Kraft pulp mill ocean outfalls was shown to be an effective tool in the study of waste disposal sites. This technique is not limited by sea conditions and permits monitoring and evaluation of outfall sites throughout the year. Photography taken at one instant provides comprehensive information throughtout the waste field. Manpower requirements and costs for this method are considerably less than for conventional boat sampling surveys. Field studies were conducted on the waste plumes from Kraft pulp mill ocean outfalls at Newport and Gardiner, Oregon and Samoa, California. Waste concentrations were measured by conventional boat sampling techniques while aerial photography was taken of the outfall area from altitudes ranging from 3,000 to 11,000 ft. Computerized procedures were used to compute water currents, waste concentrations, toxicity zones and diffusion coefficients from the photography. The highest concentration measured directly over the outfalls was 2.3 percent waste by volume and the maximum area of influence with concentrations greater than 0.2 percent waste was 155 acres. The maximum concentration determined over the outfall for each field study was generally less than that shown to have a detrimental effect on young salmon for a 14-day exposure. Surface water current was found to be the dominant factor in the resulting plume pattern. During periods of low current velocities in the receiving water, the hydraulic head created by the effluent source was a significant factor in the resulting plume shape. The steady state form of the Fickian diffusion equation and unidirectional transport velocity was not applicable to the majority of the observations. (Burgess-Oregon State)

LIQUID WASTE EFFLUENTS FROM A NUCLEAR FUEL REPROCESSING PLANT,
Northeastern Radiological Health Lab., Winchester, Mass.
P. Magno, T. Reavey, and J. Apidianakis.
Available from NTIS as PB-196 442, $3.00 in paper copy, $0.95 in microfiche. Technical Report BRH/NERHL 70-2, November 1970. 59 p, 19 fig, 27 tab, 9 ref.
Identifiers: *Radioactive contaminants, *Water pollution, *Nuclear fuel reprocessing, Water pollution, Concentration (Composition), Tritium, Ruthenium isotopes, Strontium 90, Cesium 137, Cesium 134, Purex process, Radioactive isotopes, Stream pollution, New York, Sampling, Dilution, Mixing, Sediments, Ruthenium 106, *Water pollution detection, Cattaraugus County (New York).

The liquid waste effluents from a commercial nuclear fuel reprocessing plant were studied in detail during a six-month period May through October 1969. The concentrations and amounts of individual radionuclides discharged from the plant were measured and the amounts of sedimentation of individual radionuclides in the lagoon system were estimated. Tritium, ruthenium-106, strontium-90, cesium-137 and cesium-134 were the principal radionuclides discharged to the environment during this period. No relationship could be established between the amount and burnup of fuel processed and the amount of activity discharged from the plant to the lagoon system during this study. For the Yankee fuel campaign of May-August

1969, the waste management practice and not the amount of fuel processed was the controlling factor in the amount of activity discharged from the plant to the lagoon system. Simultaneous sampling was carried out at the point of discharge of the waste and several locations on the Buttermilk and Cattaraugus Creeks. Tritium, ruthenium-106, and strontium-90 were the radionuclides present in the highest concentrations in these streams during these periods. Stream dilution and absorption factors were calculated for individual radionuclides at various locations along the stream system.

ABSTRACT OF PROCEEDINGS, HAZARDOUS POLLUTING SUBSTANCES SYMPOSIUM: ANNEX 1 TO STUDY ON CONTROL OF HAZARDOUS POLLUTING SUBSTANCES, SEPT. 14-16, 1970. NEW ORLEANS, LA.
Coast Guard, Washington, D.C.

Available from NTIS as PB-195 342, $3.00 in paper copy, $0.95 in microfiche. September 1970. 561 p.

Identifiers: *Water pollution, *Hazardous materials, *Water transportation, Water pollution, *Industrial wastes, Water pollution, Water quality, Meetings, Definitions, Government policies, Law jurisprudence, Economic analysis, Detection, Stream pollution, Oceans, Insurance, *Water pollution, Oceans, Insurance, *Water pollution detection, Water pollution damage.

A symposium was held with its principal objective being the solicitation of the views of industry, academic leaders, conservationists, state governments, and other non-federal government spokesmen on the identification and response to the uncontrolled release of hazardous polluting substances into the navigable waters of the United States. The symposium employed a panel format encompassing three areas: (1) definition and classification; (2) prevention, detection and removal; and (3) legal and economic factors. The report contains an abstract of the comments made by some 400 interested parties, along with the recommendations made by each panel.

A GENERAL REVIEW OF CONTINUOUS WATER QUALITY ANALYSIS INSTRUMENTATION,
Robert H. Jones.
Beckman Instruments, Inc. Process Instruments Division, Fullerton, Calif. 15 p.

Descriptors: *Instrumentation, *Monitoring, Water quality.
Identifiers: *Water quality monitor.

Beckman Instruments, Inc. offers a multi-parameter Water Quality Monitor for continuous measurement of: disolved oxygen, temperature, pH, chloride ion, turbidity, oxidation-reduction potential, sunlight radiation intensity and conductivity. The new instrument features sensors which improve reliability of continuous monitoring while reducing maintenance requirements. This instrument is compatible with conventional forms of transmission and data handling. Pollutants in water such as silt, slimes, soluble and suspended solids, and algae coat and contaminate sensing elements. This paper explains Beckman's approach to this problem of continuous water quality monitoring.

POLLUTION BY SEDIMENT: SOURCES AND THE DETACHMENT AND TRANSPORT PROCESSES,
Iowa State Univ., Ames. Dept. of Agricultural Engineering; and Agricultural Research Service, Beltsville, Md. Water Conservation Research Div.
H. P. Johnson, and W. C. Moldenhauer.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 1, p 3-20. 2 tab, 2 fig, 59 ref.

Descriptors: *Water pollution, *Sediments, *Sediment transport, Bed load, Suspended load, Soil erosion, Gully erosion, Sheet erosion, Rill erosion, Sediment yield, Watersheds, Iowa, Losses, Regression analysis, Specific weight, Streams, Yield equations.
Identifiers: *Detachment, *Erosion equation, Universal Soil Loss Equation, Correlation coefficient, Sediment delivery ratio, Reservoir sedimentation.

The paper attempts to identify problems in the sediment pollution area, define the present understanding of the erosion and transport process, and to indicate research needs. Gross erosion from land, including both sheet and gully erosion, is discussed, and empirical methods of quantitative measurement are presented as well as research approaches. Primary sources of sediment yield information are reservoir sedimentation surveys and suspended load samplings. Finally a look is taken at sediment in transport and its two components suspended load and bed load. The science of erosion and sediment transport needs to advance considerably if it is to be sufficiently flexible for use in detailed planning. (See also W71-05437) (White-Iowa State)

CHEMISTRY OF SEDIMENT IN WATER,
Agricultural Research Service, Morris, Minn. Soil and Water Conservation Research Div; and Minnesota Agricultural Experiment Station, St. Paul.
R. F. Holt, R. H. Dowdy, and D. R. Timmons.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 2, p 21-34. 2 fig, 1 tab, 49 ref.

Descriptors: *Sediments, *Nitrogen, *Phosphorus, Chemistry, Water pollution, Clays, Mineralogy, Montmorillonite, Illite, Colloids, Clay minerals, Organic matter, Ions, Ion exchange, Cation exchange, Anion adsorption, Oxidation-reduction potential, Nitrification, Denitrification.
Identifiers: Preferential removal, Electrical charge, Surface area, Reduced layer, Surface oxidized layer.

Sediment can be considered a major pollutant of surface waters. However, its contribution to the dissolved chemicals in lakes and streams is largely unknown. The composition of sediment closely resembles the soil from which it is derived but is generally higher in silt, clay, and organic matter. Chemical reactions involving sediment are essentially the surface chemistry of their colloidal fractions which is a function of their surface area and electrical charge. As a result, reactions with sediment can be divided into interactions with charged ions and with neutral compounds. The chemistry of sediments in situ can be surmised from studies of submerged soils. Sediments carry relatively large amounts of total nitrogen and phosphorus into surface waters, but in both cases only a small proportion of this total is readily available to the biosystem. Sediments apparently have a high capacity to remove phosphate from solution, but without turbulence the release of phosphate from bottom sediments will not support algal growth at appreciable distances from the sediment. Available inorganic nutrients, particularly phosphorus, are rapidly taken up by the biosystem in natural waters. They eventually become a part of the organic fraction of the sediment and their release back to the waters is not well resolved. (See also W71-05437) (White-Iowa State)

SIGNIFICANCE OF PHOSPHORUS IN WATER SUPPLIES,
Southern Illinois Univ., Carbondale. Dept. of Botany.
Jacob Verduin.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 5, p 63-71. 1 fig, 4 tab, 12 ref.

Descriptors: *Phosphorus, *Nutrients, Water pollution, Fertilizers, Oxygen, Nitrogen, Sewage, Effluents, Phosphates, Carbon dioxide, Odor, Taste, Eutrophication, Water sheds, Tennessee Valley Authority Project, Detergents, Farm wastes, Lagoons.
Identifiers: *Plant nutrients, N/P ratio, Enrichment.

The author gives data showing the marked increase in total phosphorus concentrations in our streams and lakes. Although there has been a large increase in agricultural fertilizer use, evidence suggests that approximately one-third of the phosphorus contributions may come from agricultural watersheds. In urban sewage effluents, detergents seem to contribute about three times more phosphate than is contributed by the organic matter in sewage. Consequently, detergents would appear to be the most significant single source of phosphates enriching our waters today. The author contends that animal and domestic wastes belong on the land as fertilizer and soil improvers rather than discharging nutrient rich lagoon and sewage plant effluents directly to streams. As such, agriculture has a primary role to play in the solution of the pollution problem. In the problem of removing concentrated nutrients from water, agricultural technology can make a major contribution in the application of the living root zone filter to the process of plant nutrient removal. BEHAVIOR OF SOIL AND FERTILIZER PHOSPHORUS IN RELATION TO WATER POLLUTION,
Iowa State Univ., Ames. Dept. of Agronomy.
C. A. Black.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 6, p 72-93. 10 fig, 1 tab, 57 ref.

Descriptors: *Phosphorus, *Soils, Water pollution, Phosphates, Fertilizers, Solubility, Organophosphorus compounds, Groundwater, Surface waters, Aqueous solutions, Saturation, Distribution, Adsorption.
Identifiers: *Orthophosphate, Plant residues, Concentrations, Biological cycle, Phosphorite, Langmuir equation, Reaction capacity.

The principal objective of this chapter is to present an account of selected aspects of the behavior of soil and fertilizer phosphorus as a basis for understanding how phosphorus from these sources may contribute to the phosphorus content of waters in the soil and leaving the soil. Chemical and geologic phosphorus cycles in the soil are traced. The reactions and distribution of fertilizer phosphorus in soil are described. The distribution of both inorganic and organic phosphorus is pointed out. (See also W71-05437) (White-Iowa State)

SOURCES OF NITROGEN IN WATER SUPPLIES,
Geological Survey, Denver, Colo.
Marvin C. Goldberg.

Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 7, p 94-124. 4 fig, 8 tab, 72 ref.

Descriptors: *Nitrogen, *Nitrates, Groundwater, Ammonia, Precipitation, Sediments, Denitrification, Runoff, Ureas, Fertilizers, Drainage water, Irrigation, Return flow, Water supply, Livestock, Sewage, Infiltration, Industrial wastes, Algae, Ponds, Farm wastes.
Identifiers: *Surface waters, Geological sources, Mineralization, Nitrogen sources, Well water, Feedlots.

Water supplies can be categorized as surface waters or groundwaters. This paper examines representative studies of nitrate entrance to both types of water supplies, with summaries of some of the many laboratory and field studies described in the current literature. Some of the sources of nitrogen entrance to water supplies include atmospheric, geologic, rural and urban runoff, sewage, irrigation, animal wastes, and industrial wastes among many others. Sources of major importance to both surface and groundwater supplies are pointed out and field or laboratory studies are reported. (See also W71-05437) (White-Iowa State)

CHEMISTRY OF NITROGEN IN SOILS,
Illinois Univ., Urbana. Dept. of Agronomy; and Missouri Univ., Columbia. Dept. of Agronomy.
F. J. Stevenson, and G. H. Wagner.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 8, p 125-141. 8 fig, 26 ref.

Descriptors: *Nitrogen, *Nitrates, *Ammonium compounds, Fertilizers, Inorganic compounds, Nitrites, Microorganisms, Climates, Nitrification, Denitrification, Leaching, Organic matter, Amino acids, Lignins, Chemistry, Soils.
Identifiers: *Fixation, Mineralization, Immobilization, Volatilization, Amines, Pyrimidine.

This review emphasizes the complex nature of soil nitrogen. Other than gaseous forms, the inorganic N consists primarily as NH4 (..) and NO3 (-). Part of the NH4 (..) is bound to colloidal surfaces and behaves according to classical reactions of exchange chemistry. Nitrate is free to move with the soil water and is the form of N which is of greatest concern from the standpoint of pollution of water supplies. Many soils contain appreciable amounts of NH4 (..) that cannot be utilized directly by plants and microorganisms; this NH4 (..) is held within the lattice structures of clay minerals. Less than one-half of the organic N in soils can be accounted for in known compounds (amino acids, amino sugars, purine and pyrimidine bases, etc.). The remainder may occur as part of the structures of humic and fulvic acids. Part of the N added to soils as fertilizers can be converted to organic forms by chemical reactions involving NH3 (..) and NO2 (-); this combined N is only slowly mineralized and may persist in soil for prolonged periods. Bacterial denitrification is an important factor regulating NO3 (-) levels in natural soil and may serve as a means of reducing the NO3 (-) content of groundwater when land is used for the disposal of nitrogenous wastes. THE PESTICIDE BURDEN IN WATER AND ITS SIGNIFICANCE,
Federal Water Pollution Control Administration, Athens, Ga. Southeast Water Lab.
H. Page Nicholson.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 12, p 183-193. 3 tab, 32 ref.

Descriptors: *Pesticides, *DDT, Toxicity, Dieldrin, Chlorinated hydrocarbon pesticides, Aldrin, Endrin, Heptachlor, Runoff, Water pollution, Industrial wastes, Insecticides.
Identifiers: *Environmental contamination, Concentrations, Sources, Parathion, Pesticide pollution.

Sources of pesticide polluted water include runoff, industrial wastes, accidents and carelessness. Graphic examples of each are given to gain perspective about the potential for pesticide involvement in water pollution. The significance of chlorinated hydrocarbon pesticides with respect to water pollution is shown. Concentrations in some lakes and streams has increased. A final section on control of pesticide pollution gives ideas and methods which should result in less water pollution by pesticides. (See also W71-05437) (White-Iowa State)

HERBICIDE RESIDUES IN AGRICULTURAL WATER FROM CONTROL OF AQUATIC AND BANK WEEDS,
Agricultural Research Service, Denver, Colo. Crop Research Div; and Agricultural Research Service, Laramie, Wyo. Crops Research Div.
F. L. Timmons, P. A. Frank, and R. J. Demint.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 13, p 194-208. 4 tab, 31 ref.

Descriptors: *Herbicides, *2-4-D, *Aquatic weed control, Dalapon, 2-4-5-T, Alligator weed, Copper sulfate, Ponds, Pond weeds, Reservoirs, Irrigation canals, Sprinkler irrigation, Furrow irrigation, Drainage, Water hyacinth, Runoff.
Identifiers: *Herbicide dissipation, Drainage ditches, Submersed weeds, Amitrole, Silvex.

The effectiveness of herbicides and the economics involved in agricultural production have caused their extensive use for weed control in and adjacent to aquatic areas, especially on irrigation systems. Greater use of herbicides in and around agricultural waters may be expected. Maximum residues of herbicides used for weed control in farm ponds and reservoirs are low, ranging from a fraction of 1 ppm to several ppm. In most cases these levels are of short duration. The transport of herbicide residues in irrigation water prevents extensive exposure of any given irrigated area. The flowing water may at times carry residues to areas where their presence may be objectionable. While reduction in residue level varies with canal and herbicide, many residues are dissipated after a water flow of 10 to 15 miles. In most cases, the dissipation can be attributed to dilution in water or absorption by bottom mud. The concentrations of herbicides found in irrigation water are unlikely to cause injury in crops. Where residues were found in crops following irrigation with water containing herbicides, the levels were generally much lower than tolerances already established for the same or similar crops. NITROGEN AND AMINO ACIDS IN THE FECES OF YOUNG PIGS RECEIVING A PROTEIN-FREE DIET AND DIETS CONTAINING GRADED LEVELS OF SOYBEAN OIL MEAL OR CASEIN,
Guelph Univ. (Ontario). Dept. of Nutrition.
Kathleen H. Carlson, and H. S. Bayley.
Journal of Nutrition, Vol 100, No 11, p 1353-1361, 1970. 5 tab, 3 fig, 17 ref.

Descriptors: *Nitrogen, *Amino acids, *Proteins, *Diets, Farm wastes, Hogs, Water pollution sources.
Identifiers: Young pigs, Protein-free diets, Casein, Soybean oil meal.

Thirty-two piglets were weaned at 14 days of age and received a nutritionally complete diet; at 20 days of age they were allocated to either a protein-free diet, or diets containing 7, 14, or 21% protein from either soybean oil meal or casein. Feed consumed between 21 and 31 days of age was measured and the feces voided were collected. The n-butyl-N-trifluoroacetyl esters of the amino acids in hydrolysates of feed and feces were separated by gas-liquid chromatography. The amounts of fecal nitrogen and of each of the 13 amino acids of metabolic origin were calculated directly from the observations made on the protein-free diet and indirectly by regression analyses of the outputs of the piglets receiving the diets containing graded levels of protein. The metabolic fecal nitrogen excretion determined directly (111 mg. N.100 g. feed consumed) agreed more closely with other published values than the indirect estimates obtained by regressions. The direct values were used in calculating the corrected digestibilities of the nitrogen and of the amino acids in the two protein sources. The corrected digestibilities of the nitrogen and amino acids in the casein were very high (97 - 100%), but were lower for the soybean meal. There were significant differences in the corrected digestibilities of the individual amino acids in the soybean oil meal, which ranged from 82% for alanine to 93% for glutamic acid. The level of inclusion of casein did not influence the corrected digestibilities of the amino acids, but increasing the level of soybean oil meal in the diet caused a significant reduction in the corrected digestibilities of isoleucine, leucine and proline. agoon water from cattle feedlot runoff was added
undisturbed soil columns 42 cm long and 6.7 cm
diameter. The infiltration rate of the lagoon
ater into the columns was measured and
corded. After each run, the soil columns were
ctioned into 3-cm increments and analyzed for
a, Mg, Na, K, and NH4 ions. Also the electrical
nductivity of a saturation extract from the top 15
n of each column was determined. Water flow in
e soil columns stopped for all soils before two
re volumes of filtrate could be collected. The
rcentages of Na, K, and NH4 ions increased in
e surface increments of the soil columns. The
ctrical conductivity of the saturation extracts for
soils was increased by more than 200% by ad-
ng the lagoon water to the soil. The saturation ex-
ct of the treated soils had electrical conductivity
lues of between 2.80 and 5.05 mmhos/cm. (K-

ected to oil pollution. Mallard ducks were the
nary test species used. Aspects of the pathology
ome of the waterfowl species involved in the
ta Barbara oil slicks were also investigated.
ough some refined petroleum products contain
c compounds, the Santa Barbara crude used as
st oil in this study produced no apparent ill ef-
s. Polycomplex A-11 was found to be a rapid
effective cleansing agent for the removal of oil
bird plumage. Oil on bird plumage alters
her structures by replacing the small air
kets between barbules of the feather, thereby
easing buoyancy and insulation. Removal of oil
down feathers is more difficult than from the
our feathers. Ducks and geese are amendable
eatment and post-treatment care than are the
e aquatic fowls, such as grebes, loons, auks and
res. Confinement times should be as brief as
ible, as the incidence of mycotic and other in-
ous diseases increases under long periods of
e confinement.

PLANKTON DIATOM ASSEMBLAGES IN LAKE MICHIGAN,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
E. F. Stoermer, and J. J. Yang.
Copy available from GPO, SOD, No I67.13/4:18050DKC. 12/69, $2.00. Also available from NTIS as PB-198 087, microfiche $0.95. Water Pollution Control Research Series 1805ODKC, 12/69, Dec 1969. 268 p, 65 ref, append. FWQA Program 18050 DKC.

Descriptors: *Plankton, *Diatoms, *Lake Michigan, Sampling, Population, Water pollution effects, Plants.
Identifiers: Diversity estimates.

The various elements of Lake Michigan plankton diatom flora, their seasonal cycles, and history of changes were determined and genera and species are listed. Absolute frequency, relative frequency, and contribution to diversity of each taxon were computerized. Occurrence of the different entities were recorded: those associated with certain water quality conditions; constitutents of only extremely oliogotrophic floras, rapidly replaced in disturbed portions of the lake; those more tolerant of changing conditions but rapidly reduced in abundance with extensive chemically measurable changes; other entities seemingly favored by slight increases in trophic level, flourishing in moderately disturbed portions of the lake, but declining when pollution increases; those formerly able to thrive only in naturally eutrophic estuaries and inshore areas, favored by increasing pollution and now flourishing in highly disturbed open lake areas; the final general group of dominant plankton species including those taxa, apparently not able to live in the original conditions of Lake Michigan but introduced following pollution. All of the plankton diatoms associated with extreme water quality degradation in the Great Lakes system are now present in Lake Michigan, indicating critical pollution levels. (Jones-Wisconsin)

REPORT ON BIOLOGICAL, CHEMICAL, AND GEOLOGICAL STUDIES OF BOIS BRULE AND POPLAR RIVER WATERSHEDS,
Wisconsin State Univ., Superior. Center for Lake Superior Environmental Studies.
Albert Dickas, Donald Bahnick, Donald Davidson, Joseph Horton, and Ronald Roubal.
Wisconsin Univ, Madison, Water Resources Center, 1970. 5 p. OWRR Project A-023-WIS (8).

Descriptors: *Rivers, *Eutrophication, *Forests, Streams, Erosion, Clays, Hydrogen ion concentration, Watersheds (Basins), Sedimentation.
Identifiers: *Deforestation, Specific conductance, Bois Brule River (Wis), Popular River (Wis).

A comparison of the eutrophication status of two rivers in northern Wisconsin revealed a pronounced negative influence of deforestation. The Bois Brule River with its forest surroundings is much less subjected to runoff than the Popular River located in a deforested watershed. The effect of forest cover is conspicuously reflected in dynamics of two chemical characteristics of water: only small fluctuation of pH value during rainy and rain-free periods, and a decrease rather than an increase in specific conductance on pluvial days. The reverse was observed on the Poplar River whose watershed includes highly erodible lacustrine clay. (Wilde-Wisconsin)

TOXICITY OF ZINC, COPPER AND LEAD TO CHLOROPHYTA FROM FLOWING WATERS,
Durham Univ. (England). Dept. of Botany.
B. A. Whitton.
Archiv fur Mikrobiologie, Vol 72, p 353-360, 1970. 1 tab, 7 ref.

Descriptors: *Indicators, *Algae, *Heavy metals, *Toxicity, Copper, Chlorophyta, Water pollution, Nutrients, Rivers, Lakes, Farm ponds.
Identifiers: *Zinc, *Lead, Stigeoclonium tenue, Cladophora glomerata, Ulotrichales, Zygnemales, Oedogonium, Mougotia, Sporotetras pyriformis, Gongrosira, Microspora, Spirogyra, Ulothrix.

The biological and economic interest of heavy metals in the relation to freshwater algae led to a survey of toxicity of zinc, copper, and lead to Chlorophyta in flowing waters. Twenty populations each of Stigeoclonium tenue and Cladophora glomerata were tested for variations in metal resistance. The only indication found was a slight increase in resistance to zinc of one Stigeoclonium population from a metal-polluted stream. Thirty-five other algal populations, representing about 25 species, were also tested. Comparison of these populations showed that in the test medium used Cladophora glomerata was the most or almost the most sensitive to all three metals. It was absent from streams known to be polluted by lead or lead and zinc. The Ulotrichales and most of the Zygnemales were relatively resistant to zinc, while all the Oedogonium species taken from the field were sensitive to zinc. However, an Oedogonium population highly zinc resistant was obtained from a zinc enriched laboratory tank. Because the medium used in the present experiments is relatively rich in nutrients such as phosphates it may well mask effects that would show in a less favorable environment. (Jones-Wisconsin)

MUSSELS (UNIONIDAE) OF THE RED RIVER VALLEY IN NORTH DAKOTA AND MINNESOTA, USA,
North Dakota Univ., Grand Forks. Dept. of Geology.
Alan M. Cvancara.
Malacologia, Vol 10, No 1, p 57-92, 1970. 9 fig, 4 tab, 44 ref. OWRR Project A-007-NDAK (1).

Descriptors: *Mussels, *Water pollution effects, North Dakota, Minnesota, Tributaries, River systems, Chlorides, Turbidity, Stagnant water.
Identifiers: *Red River (ND), Unionidae, Lampsilis siliquoidea, Lasmigona complanata, Anodonta grandis, Anodontoides ferussacianus.

This paper lists 13 species of mussels inhabiting the northern part of the Red River and 18 species in its tributaries in eastern North Dakota and western Minnesota. The most common species are: Lasmigona complanata, Anodonta grandis, Anondontoides ferussacianus, and Lamsilis siliquoidea. Although the Red River is a part of the Mississippi system, its fauna constitutes only 1/4th of the main stream. The restricted distribution of mussels is attributed to the prolonged lack of river flow, high content of chlorides, water pollution, and high turbidity. (Wilde-Wisconsin)

INFLUENCE OF INDUSTRIAL EFFLUENTS ON ARTHROPODS OF THE MARINE SUPRALITTORAL ZONE, (IN GERMAN),
Erlangen-Nuremberg Univ. (West Germany). Zoologisches Institut.
Hermann Remmert.
English summary. Oecologia (Berl), Vol 5, p 158-164, 1970. 3 tab, 10 ref.

Descriptors: *Sea water, *Marine animals, *Oil, *Water pollution effects, Industrial wastes, Mortality, Toxicity, Insects.
Identifiers: *Arthropods, *Oil pollution, Burning oil, Crude oil.

Both investigated organisms, the fly Limosina brachystoma, and the amphipod Orchestia platensis, can survive for several weeks in foliage moistened with 1.5% solution of sodium chloride.

Yet, pollutants of burning oil in contact with water are fatal to these organisms even in very low concentrations. The air, however, is freed from the toxic ingredients within one week. Crude oil which floated in the sea for a prolonged period also is not poisonous to the arthropods or their larvae. On the other hand, the organisms, especially Orchestia, have a very low resistance against sulfuric acid. (Wilde-Wisconsin)

EUTROPHICATION: CAUSE--EFFECT RELATIONSHIPS,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
Earl E. Shannon, and Patrick L. Brezonik.
Dep of Environmental Engineering, Florida University, Gainesville (Undated). 59 p, 4 fig, 13 tab, 30 ref. OWRR Project B-004-FLA (3).

Descriptors: *Lakes, *Trophic level, *Florida, Eutrophication, Watersheds, Analysis, Color, Indicators, Primary productivity, Chlorophyll, Nitrogen, Phosphorus, Transparency, Conductivity, Regression analysis.
Identifiers: Trophic state indices.

This study was concerned with the relationship between the trophic state of 55 Florida lakes and their watershed characteristics. On the basis of cluster analysis, the lakes were grouped into 24 colored and 31 relatively clear lakes. All of the lakes were further subdivided into trophic groups delineated by values of 7 trophic state indicators: primary production, chlorophyll a, total organic nitrogen, total phosphorus, disc transparency, conductance, and sodium .. potassium:calcium .. magnesium ratio. Multiple regression analyses revealed a significant relationship between values of trophic state indices (TSI) and characteristics of watersheds including land use, extent of fertilizer treatments, and density of population. Canonical analyses of trophic variables and eutrophication-causing factors gave similar results. (Wilde-Wisconsin)

REACTION RATES OF PHOTOSYNTHESIS,
Green Engineering Affiliates, Somerville, Mass.
M. M. Varma, and R. S. Talbot.
Proceedings Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, July 1965, p 146-174. 20 fig, 5 tab, 33 ref.

Descriptors: *Light intensity, *Photosynthesis, *Chlamydomonas, Aquatic environment, Aquatic microorganisms, *Hydrogen ion concentration, *Temperature, Water pollution effects.
Identifiers: Buffer.

Investigations were made to study the effect of changing intensity of light, pH, temperature, and age culture on the rate of photosynthesis of Chlamydomonas. Observations of the rate of photosynthesis were made with a sodium bicarbonate-carbonate buffer and a potassium bicarbonate-carbonate buffer. Studies were also made to establish a correlation between the weight and number per unit volume of Chlamydomonas organisms using the gravimetric method and the membrane filter technique. The rate of photosynthesis increased with temperature at a given initial pH and light intensity. Under given conditions, there is optimum light intensity at which the rate of photosynthesis is a maximum and the intensity of light is more critical at 25C than at 30C. It was also found that essentially a straight line relationship exists between weight and number per volume of Chlamydomonas. (Ellis-Texas)

INTRODUCTION, PROCEEDINGS OF 2ND THERMAL WORKSHOP OF UNITED STATES INTERNATIONAL BIOLOGICAL PROGRAM,
Maryland Univ., College Park.
J. A. Mihursky, and J. B. Pearce.
Chesapeake Science, Vol 10, No 3, p 125-127, Sept-Dec, 1969.

Descriptors: *Thermal pollution, Temperature, Environmental engineering, Heat, Thermal powerplants, Aquatic plants, Aquatic life, Water pollution.
Identifiers: Temperature effects.

Highlights of the second Thermal Workshop held at the Chesapeake Biological Laboratory of the University of Maryland, Nov. 3-7, 1968, are outlined. The conference theme centered on the effects of temperature and temperature change on the aquatic environment. It was stated that aquatic inhabitants have specific and seasonal temperature requirements that must not be exceeded. Constructive use of waste heat has sound theoretical foundations. Temperature alterations resulting from man's activities have caused changes in distribution and abundance in plant and animal population. Temperature alterations were recognized as only one of many instances of accelerated environmental modification due to man's activities. (Novotny - Vanderbilt)

BIOLOGICAL REACTIONS AND PATHOLOGICAL CHANGES OF HUMAN BEINGS AND ANIMALS UNDER THE CONDITION OF ORGANIC MERCURY CONTAMINATION,
Kumamoto Univ. (Japan). Medical School.
Tadao Takeuchi.
Presented at International Conference on Environmental Mercury Contamination, Ann Arbor, Michigan, 1970. 30 p, 76 ref, 16 fig, 11 tab.

Descriptors: *Heavy metals, Water pollution effects, Human pathology, Diseases, Epidemiology, Toxicity, Water quality, Water pollution, Air pollution, Chemical wastes, Industrial wastes.
Identifiers: Mercury pollution, Mercury effects, Mercury contamination.

Organic mercury contamination results from (1) some mercury residue produced in chemical plants; (2) fungicides used widely in farms, (3) erratic use of disinfectants and fungicides for medical supplies and clothes and, (4) other unknown factors. Factors (1) and (2) are connected with the dumping of mercury into the water from the chemical industry. On the basis of investigations on Minamata disease brought about by organic mercury contamination, the biological reactions and pathological changes were discussed. The clinical symptoms of the disease are cerebellar atoxia, constriction of visual fields, and dysarthria. Other symptoms are those resulting from the lesion of the cerebral cortex and peripheral nerves, particularly sensory peripheral nerves of extremeties. It was found that alkylmercury, particularly methylmercury compounds may contaminate environmental subjects with the effluent from the plants and they are absorbed by organisms, accumulated in some organs and tissues, and give rise directly and indirectly to various disturbances of human beings and animals. (Novotny-Vanderbilt)

THE ABSORPTION OF MERCURY FROM FOOD, ITS SIGNIFICANCE AND NEW METHODS OF REMOVING MERCURY FROM THE BODY,
Rochester Univ., N.Y.
T. W. Clarkson, and R. E. Shapiro.
Presented at Symposium on 'Mercury and Man's Environment', February 15 and 16, 1971, Royal Society of Canada, Ottawa. Typescript, 9 p, 2 tab, 3 fig.

Descriptors: *Heavy metals, *Toxicity, *Food Fish, Metals, Water pollution, Water pollution effects, Food chains, Human pathology, Wastes, Environmental engineering.
Identifiers: Mercury, Mercury pollution.

According to studies in Sweden and the USA, the mercury present in fish muscle is in the form methyl mercury compounds. The form of mercu in non-aquatic food products is, as yet, general undefined. The experimental results of the kineti of the mercury metabolism in experimental anima (mice) is presented. Three stages of mercury co tamination can be distinguished: (1) state of i creased mercury level, (2) steady state, when i take of mercury from food is exactly balanced excretion, and (3) after removing the animals fro exposure to mercury, the amount in the bo declines. The problem of mercury in food is methyl mercury problem. A new means of remo ing methyl mercury from the body could trapping mercury in the intestines so as to preve reabsorption. Polystyrene resins were used for th purpose. Mice fed food with 1% resin excrete mercury 3 times faster than control mice, and, aft 22 days, had only 20% of the mercury level in bra tissue as the controls did. (Novotny-Vanderbilt)

EMBRYOTOXICITY OF MERCURY COM POUNDS,
Food and Drug Directorate, Ottawa (Ontario Div. of Toxicology.
David J. Clegg.
Presented at Symposium on 'Mercury and Man Environment', February 15 and 16, 1971, Roy Society of Canada, Ottawa. Typescript, 9 p.

Descriptors: *Heavy metals, *Human patholog *Toxicity, Pathology, Animal pathology, Disease Environmental effects, Epidemiology, Water pollu tion, Nutrient requirements, Food chains.
Identifiers: *Mercury, Metals effects, Mercury po lution, Mercury effects.

The information currently available regarding th embryotoxic activity of the alkyl mercurial com pounds is reviewed. These compounds appear to b the mercury compounds of most crucial concern t man. In the case of the alkyl mercurial compounds the embriotic effects apparently result from direc toxic action of the parent compound on the foetu or embryo, and possibly also by damaging th gametes prior to fertilization. Alkyl mercurials ca exert embryotoxic, or teratogenic activity i laboratory animals. Human data available fro Japan are also discussed and these confirm the im plications from laboratory animal studies. Th minimum dose level tested (mg/kg-day) ha resulted in indications of embryotoxic activity in a least one experiment. The present temporary ac ceptable daily intake, according to Swedish esti mate, of 0.0004 mg/kg-day is based upon huma blood levels in cases of minimal signs of huma mercury intoxication. This figure may have to b reduced as further information becomes available (Novotny-Vanderbilt)

THE EFFECTS OF THERMAL DISCHARGES ON THE STRATIFICATION CYCLE OF LAKES
Cornell Aeronautical Lab., Inc., Buffalo, N.Y.
T. R. Sundaram, and R. G. Rehm.
AIAA 9th Aerospace Sciences Meeting, New York, AIAA Paper No 71-16, January 25-27, 1971 11 p, 4 fig, 1 tab, 22 ref.

Descriptors: *Stratification, *Lakes, *Powerplants Epilimnion, *Thermal pollution, Thermocline Temperature, Mathematical models.
Identifiers: Thermal discharges.

The effects of power-plant thermal discharges on the seasonal stratification cycle of temperate lakes are considered. A theoretical model, which includes the interaction between wind-induced tur bulence in the lake and the buoyancy gradients due

to surface heating as well as the thermal discharges, is developed and solved numerically for some typical cases. It is shown that the thermal discharges increase the temperature during spring homothermy, and the stratification period. The increases in temperatures due to thermal discharges, are greater at deeper levels than at the surface. Under certain conditions, thermal discharges may lead to a reduction in the epilimnetic volume. This article contains 22 references. (Upadhyaya-Vanderbilt)

THE EFFECT OF VARYING AND CONSTANT TEMPERATURES ON THE SIZE OF A MARINE COPEPOD,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology.
Anthony R. Lock, and Ian A. McLaren.
Limnology and Oceanography, Vol 15, No 4, p 638-640, July 1970. 2 tab, 10 ref.

Descriptors: *Thermal pollution, Temperature, Foods, Light, Size.
Identifiers: Marine copepods.

One-hundred stage three copepodites of Pseudocalanus Minutus were reared to maturity in the laboratory in an excess of food at about 5, 8, and 12C. Mean length of adult females was inversely related to temperature, but that of adult males was unaffected. Mean length of females reared in a light-temperature regime of alternately 12 hr. at 8C in weak light and 12 hr. at 12C in darkness did not differ significantly from estimated mean length at a constant, intermediate temperature of 10C. These experiments suggest that vertical migration in thermally stratified waters will not enhance length of this species. (Upadhyaya-Vanderbilt)

THE MIXING OF A SHALLOW SUBMERGED HEATED WATER JET WITH AN AMBIENT RESERVOIR,
Maryland Univ., College Park. Dept. of Mechanical Engineering.
Atul M. Mahajan, and James E. A. John.
AIAA 9th Aerospace Sciences Meeting, New York, AIAA Paper No 71-17, p 12, January 25-27, 1971. 12 fig, 1 tab, 3 ref.

Descriptors: *Thermal pollution, *Temperature, Heated water, Dimensional analysis, Velocity, Heat transfer, Mixing.
Identifiers: *Shallow submerged jet, Two-dimensional, Prandtl number.

The work reported here is an attempt to provide information on the discharge of submerged turbulent two-dimensional hot water jet near the surface of a reservoir. Experimental tests were made in a tank 8 ft. long and 6 inches wide and 4 ft. deep, with jet velocity 8 fps and jet temperature 0C, 50C and 60C above the tank temperature. Velocities were measured with a hot film probe, temperatures with copper constantan thermocouples. Empirical dimensionless correlations were obtained which yielded the path of the point of maximum velocity in the jet as it moved towards the surface. Below the point of maximum velocity, velocity and temperature distributions were similar to those of a deeply submerged jet. Above this point, temperatures were considerably higher than those of a deeply submerged jet. The buoyancy, in the case of a heated water jet has negligible effect on the flow pattern of a shallow submerged jet, but has significant effects on the flow patterns of a deeply submerged jet. THERMAL POLLUTION, AQUACULTURE AND PATHOBIOLOGY IN AQUATIC SYSTEMS,
Maryland Dept. of Research and Education, Solomons. Chesapeake Biological Lab.
J. A. Mihursky, A. J. McErlean, and V. S. Kennedy.
Journal of Wildlife Diseases, Vol 6, p 347-355, October 1970. 6 fig, 31 ref. OWRR Project A-002-MD (8).

Descriptors: *Thermal pollution, *Temperature, *Aquatic life, *Pathology, Aquatic environment, Animal pathology, Plant pathology, Biology, Thermal powerplants, Fish, Aquatic bacteria, Environmental engineering.
Identifiers: Temperature effects.

The effect of higher than normal temperatures on aquatic life are discussed. Thermal-biotic predictive models that describe two categories of temperature relationships to estuarine fauna have been developed. The expected present temperature increase due to steam electric stations is about 5-15C. The temperature increase, besides the possible lethal influence on aquatic organisms, may also result in sub-optimal physiological conditions from the standpoint of pathology, which means that this state presents an opportunity for pathogenic organisms to overcome their host species. A number of operational factors from steam electric stations other than temperature are responsible for detrimental effects on aquatic organisms (chlorine, heavy metals, mechanical effects). A closed recycle and reuse waste water system to produce useful foodstuff is proposed and discussed. (Novotny-Vanderbilt)

TEMPERATURE CONTROL IN OUTDOOR EXPERIMENTAL PONDS,
Minnesota Univ., Minneapolis.
H. Stefan, E. Silberman, P. Vaidyaraman, and W. Geiger.
St. Anthony Falls Hydraulic Laboratory, Proj Rep No 116, Dec 10, 1970. 16 p. FWQA Program 18050 euj.

Descriptors. *Temperature control, *Ponds, *Heat transfer, Cooling, Heating, Model studies, Research facilities, Evaporation, Conduction, Radiation, Temperature, Environmental engineering, Air temperature, Water temperature, Heat balance, Heat exchangers, Thermal pollution.
Identifiers: Experimental models.

A system of outdoor experimental ponds for the study of aquatic life under the effect of various controlled water temperatures has been designed. The ponds were to be located near power plants in Minnesota. The purpose of the study is to determine the feasibility of maintaining certain specified temperature regimes in the proposed ponds. This was done by considering the available heating and cooling capacity and the environmental conditions prevailing at the selected site and making design calculations for the major elements of the system. Firstly, the limits of feasible temperature control were determined. Secondly, heating and cooling systems were devised and thirdly, a method of control was developed. For cooling, use of the well water is proposed, and, for heating, the water released from the thermal power station is going to be used. External and internal heat exchange systems were examined and both were found to be feasible and adequate. The study has the character of a feasibility study. (Novotny-Vanderbilt)

THERMAL CRITERIA - A MEASURE TO CONTROL THERMAL POLLUTION,
New York State Dept. of Health, Albany.
Satyendra P. Mathur, and Donald B. Stevens.
Presented January 1970 at Cooling Tower Institute in New Orleans. Transcript. 10 p.

Descriptors: *Temperature standards, *Thermal pollution, Thermal power plants, Temperature, Temperature effects, Cooling, Streams.

The major source of thermal pollution is cooling water released from different industries, i.e. steam electric plants, shell mills, etc. The effect of thermal discharges on the receiving waters can be divided into three broad categories: physical, chemical, and biological. The New York State approach to controlling discharges of heated waters is discussed. As a thermal discharge a waste (cooling) water with temperature greater than 70 deg F is understood. Thermal criteria are adopted for fresh and tidal waters. The criteria for all categories (non-trout waters, trout waters and lakes; coastal waters and estuaries) are discussed. (Novotny-Vanderbilt)

POWER PLANTS: EFFECTS OF CHLORINATION ON ESTUARINE PRIMARY PRODUCTION,
Maryland Dept. of Research and Education, Solomons. Cheasapeake Biological Lab.
D. H. Hamilton, Jr., D. A. Flemer, Carolyn W. Keefe, and J. A. Mihursky.
Science, Vol 169, p 197-198, July, 1970.

Descriptors: *Thermal powerplants, *Chlorination, *Aquatic microorganisms, Water pollution, Water quality, Primary productivity, Estuaries, Photosynthesis, Temperature, Thermal pollution.
Identifiers: Effects of chlorination.

Steam electric stations may reduce primary production of cooling water by 91 percent as a result of chlorine applications for control of fouling organisms. Bacterial densities and concentrations of chlorophyll are also reduced. Slight stimulation of production may occur in the absence of chlorination. Based on the available supply of 'new' water a maximum loss of primary production of 6.6 percent for the adjacent tidal segment of the Patuxent River was calculated. The results of experiments designed to examine the effect of plant operation on primary productivity are presented. (Novotny-Vanderbilt)

SOME ASPECTS OF BIOLOGY OF CARCINUS MAENAS (L) II SURVIVAL AT LOW SALINITY,
University of Strathclyde, Glasgow (Scotland). Dept. of Biology.
E. J. Perkins, E. Gribbon, and R. B. Murray.
The Transactions of the Dumfriesshire and Galloway Natural History and Antiquarian Society, 3rd ser vol 46, p 27-28, 1969. 4 ref.

Descriptors: *Salinity, *Crabs, Salt tolerance, Predation, Lethal limit.
Identifiers: Aspects, Carcinus maenas, Green shore crab.

The green shore crab, Carinus maenas, is an important predator of animals dwelling in inshore waters. In the laboratory, crabs were subjected to a range of salinity from 1.0 to 8.4%, with the mean temperature 8.4 deg. Salinities slightly less than 2% were rapidly lethal. Between 2 - 3% survival was dramatically improved for 1-34 days. Size was important in survival up to 6%, but of 5% large and small animals survived equally well. (Wahtola-Washington)

TEMPERATURE SELECTION AND HEAT RESISTANCE OF THE MOSQUITO FISH, Gambusia affinis,
Arkansas Univ., Fayetteville.
Edmond j. Bacon, Jr., William H. Neill, Jr., and Raj V. Kilambi.

Proc of the 21st Annual Conference of the Southeastern Association of Game and Fish Commissioners, p 411-416, 1967. 3 fig, 5 ref. OWRR Project A-007-ARK (3).

Descriptors: *Temperature, *Heat resistance, *Fish, Thermodine, Sexual maturity, Fish physiology, Warm water fish.
Identifiers: Gambusia affinis, Thermal distribution, Mosquito fish.

The temperature selection and heat resistance of the mosquito fish is described. The average selected temperature of a sample of Gambusia affinis previously acclimated to 20 deg C decreased from 28-29 deg C to about 27 deg C after the fish had lived in a temperature gradient tank for one month. The final thermal distribution of the fish varied with sex and developmental stage. Males selected lower temperatures than did adult females. The young fish, although more scattered than the adults, occurred mostly at temperatures higher than those selected by the adults. These results may indicate temperture separation of young and adult fish in nature which would reduce intraspecific predation and competition. Heat resistance of adult females taken from the 26.2 deg C-compartment of the temperature-gradient tank was higher than the resistance of 28.0 deg C acclimated fish. The temperature-gradient females either had attained a high acclimation level by temporarily venturing above 28.0 deg C or had accumulated high resistance by living at varying temperatures below 28.0 deg C. (Wahtola-Washington)
W71-06180

THE EFFECTS OF THE HERBICIDES DIQUAT AND DICHLOBENIL (CASORON) ON POND INVERTEBRATES PART I. ACUTE TOXICITY,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
Dennis C. Wilson, and Carl E. Bond.
Transactions of the American Fisheries Society 98: p 438-443, 1969. 7 tab, 15 ref.

Descriptors: *Herbicides, *Toxicity, *Bioassay, *Invertebrates, *Aquatic insects, Dragonflies, Mayflies, Caddisflies, *Amphipoda, Lethal limit, *Diquat, Water pollution effects, 2-6-Dichlobenil.
Identifiers: *TL50, Casoron, IC50, Damselflies, Baetidae, Lunnephilidae, Coenagrionidae, Libellulidae.

The acute toxicity was determined for the herbicide Diquat and Dichlobenil. The median tolerance limits (TLm) of Diquat (1:1-ethylene-2:2'-dipyridylium dibromide) and Dichlobenil (2,6-dichlorobenzonitrile) to one amphipod and larvae of five species of aquatic insects were determined. Diquat was over 300 times more toxic to the amphipod (Hyalella azeteca) than to the mayfly (Callibaetis sp.) while the caddisfly (Limnephilus sp.), tendipedid (Tendipedidae), damselfly (Enallagma sp.), and dragonfly (Libellula sp.) in that order, were more resistant. The addition of pond mud to the test vessels changed the 96-hour TLm of Diquat for the amphipod from 0.046 to 6.8 mg/liter. Dichlobenil was less toxi than Diquat to the amphipod but more toxic to the aquatic insects. Dichlobenil had a narcotizing effect that was recorded as an immobilization concentration (IC50). The addition of pond mud did not reduce the toxicity of Dichlobenil to the caddisfly. The 4% granular formulation of Dichlobenil had a 72-hour 'lag' before an effective concentration was obtained equivalent to the toxic effect of the 50% wettable powder. Dichlobenil formed a strong layer at the bottom of the test vessel and was more toxic with time to the invertebrates than to the fishes Micropterus salmoides and Lepomis marochirus. (Wahtola-Washington)

DISSOLVED OXYGEN CRITERIA FOR THE PROTECTION OF FISH,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
Peter Doudoroff, and Dean L. Shumway
American Fisheries Society Special Publication No. 4, p 13-19, 1967. 3 fig, 16 ref.

Descriptors: *Dissolved oxygen, Fish physiology, Fisheries, Growth rates, Embryonic growth stage, Energy budget, Juvenile growth stage, Standards, Water quality, *Freshwater fish.

The rates of growth and embryonic development and the activity of fish can be limited by the supply of oxygen even when dissolved oxygen concentrations are near or above air-saturation levels. Oxygen concentrations well below 3 mg/liter can be tolerated for long periods by the fish and fish embryos. Fishery biologists should decline to specify any particular dissolved oxygen level as a minimal requirement of any fish population or as a proper standard of water quality unitl the necessary clear guidelines or explicit definitions of terms are provided by pollution-control agencies desiring such simple criteria. The dissolved oxygen level at which growth of fish is limited by the oxygen supply depends on the amount of food available, as well as other environmental factors such as temperature. No reduction of dissolved oxygen below natural levels probably is the only 'standard' that would afford complete protection for fishery resources under all circumstances, but adoption of this standard for the regulation of waste disposal usually would be unrealistic and unnecessary. Any lower or less restrictive standards applicable over wide ranges of temperature probably should be expressed as oxygen conentrations (mg/liter) rather than as percentages of saturation. They should be designed to prevent, by limiting diurnal or other fluctuations of dissolved oxygen, frequent exposure of fish to nonlethal but very low dissolved oxygen levels even for periods of moderate duration. The choice of suitable criteria or standards probably should be based in part on bioenergetic considerations relating to fish growth and production rates, but it is not simply and entirely a biological problem. (Wahtola-Washington)

EFFECTS OF ALKYL BENZENE SULFONATE ON BREEDING BEHAVIOR OF FLAGFISHES, Jordanella floridae,
Academy of Natural Sciences of Philadelphia, Pa.
Neal R. Foster, and John Cairns, Jr.
The ASB Bulletin, Vol 13, No 2, April 1966. 34 p. NIH Grant EF-00266.

Descriptors: *Water pollution effects, Bioassays, Detergents, Breeding, Killifishes, Alkylbenzene sulfonates, Fish behavior, Toxicity.
Identifiers: Jordanella floridae, Flagfish.

The Florida flagfish, Jordanella floridae Goode and Bean, is well suited for bioassays involving effects of toxicants in breeding behavior. Under optimum conditions, these killifishes spawn virtually daily in laboratory aquaria. Male flagfishes occupy specific bottom territories and defend these. A female can enter a male's territory and solicit spawning by undergoing a color change and 'backing' towards him in a distinctive fashion. After spawning, the male fans the substrate where the eggs were laid. Under test conditions, flagfish exhibit normal breeding behavior for at least four days' exposure to an introduced concentration of 6 p.p.m alkyl benzene sulfonate mixture (54.8% active ingredients). Significantly less breeding behavior was observed, and no viable eggs were recovered, in concentrations of 11.5 p.p.m. and 24 p.p.m ABS mixture. (Wahtola-Washington)

'KEROSENE' TAINT IN SEA MULLET (Mugil cephalus Linnaeus),
Department of Primary Industries, Brisbane (Australia).
E. M. Grant.
Fisheries Notes, Department of Harbours and Marine, Vol 3, No 1, 1969. 13 p, 1 tab, 6 ref.

Descriptors: *Mullets, Water pollution effect *Taste, Fisheries, *Fish diets, Oil wastes, Oi water, Odor.
Identifiers: *Mugil cephalus, Kerosene taint, Au tralia.

Sampling showed that fishermen were leaving larg schools of sea mullet in the belief that they we 'kerosene'-tainted, the actual level of tainting w quite low (0.28 per cent). Also, the level of taint a sessed at this time by fishermen greatly exceede that derived from a consumer panel. Consumptio of 'kerosene'-tainted sea mullet produces a mo unpleasant kerosene-like after-taste, but no oth effects were noted. Although 'kerosene'-tainted se mullet are abundant in the vicinity of Lugga Point (Brisbane R.), only about one-half of the se mullet of the area are so affected. 'Kerosene tainted sea mullet also occur in Noosa R., a rel tively unpolluted stream 75 sea miles north of th Brisbane R. It is extremely improbable that a fected fish had migrated from the Brisbane R. the Noosa R. 'Kerosene'-tainted sea mullet fro Luggage Point were active and apparently health They had been feeding heavily on a dark-gr sludge which had a metallic smell and a faintly a tringent taste. Even some small fish (9-inch) we strongly 'kerosene'-tainted. (Wahtola-Washingto W71-06185

ALGICIDES,
Wisconsin Univ., Madison. Water Resourc Center.
George P. Fitzgerald.
Available from NTIS as PB-198 130, $3.00 paper copy, $0.95 in microfiche. Wisconsin Uni Madison, Water Resources Center, Eutrophicatio Information Program, Literature Review No 1971. 50 p, 1 fig, 9 tab, 153 ref. OWRR Project W 117No 1614) (3).

Descriptors: *Algicides, *Algae, *Algal contro Testing, Laboratory tests, Chemicals, Bacteri cides, Cultures, Test procedures, Pesticide toxicit Resistance, Lakes, Reservoirs, Swimming pool Chelation, Application methods, Cooling tower Water pollution effects.
Identifiers: Detoxification, Synergism, Fish pond Algistatic activity, Algicidal activity.

An evaluation of algicides--what they are, the usage, how they are tested, their efficiency, a methods of application--is presented. Detailed a appropriate test organisms, culture and test medi the importance of algicidal versus algestatic effect and effective chemical concentrations required achieve potential toxicity. Characteristics of a algal problem, together with its environment, i fluence the methodology of application process as well as detoxification, resistance, and synergis Algal problems of water supply reservoirs a recreational lakes, fish ponds, swimming pools, a cooling towers are specifically discussed with su gestions for effective application of toxicants f their control. (Auen-Wisconsin)

SELECTIVE WITHDRAWAL AT LAK LIVINGSTON, PRELIMINARY EVALUATION 1969,
Texas Univ., Austin. Center for Research in Wat Resources.
E. G. Fruh.
Available from NTIS as PB-198 131, $3.00 paper copy, $0.95 in microfiche. Center f Research in Water Resources Report, No 5 Progress Report No 1, June 1970. 102 p, 29 tab, 1 fig, 19 ref, 7 append. OWRR Project B-040-TE (1).

Descriptors: *Computer programs, Model studie Nutrients, Microbiology, Bioassay, Water analysi Texas, Water pollution effects, Water pollutio control.
Identifiers: *Selective withdrawal, *Lake Livin ston, Kohn-Debler, Bohan-Grace, Trinity River.

A literature survey was conducted to evaluate the significance of selective withdrawal models available. Field investigations were made at several lakes and Lake Livingston to substantiate these models and to determine the changes in water quality of the Trinity River as Lake Livingston fiils. The Koh-Debler and Bohan-Grace models were used to compare data from the literature with observed results from Lake Travis. The various inputs of data and the effect of varying these inputs upon the predicted water outlet temperature were investigated. It is concluded that a broader range of test must be run before either model can be applied with confidence to Southwestern U.S. impoundments. During the tests for water quality at Lake Livingston it was found that a high influx of oxygen demanding substances and nutrients enter the reservoir via the Trinity River. Turnover of water in the reservoir also affected water quality. Selective withdrawal did not appear to be feasible for water depths less than 40 feet but the data indicated the selective withdrawal programs at greater depths will be successful. (Ellis-Texas)

THE LIFE OF MICROBES IN THE SEA AND THE CURRENT POLLUTION OUTLOOK (IN FRENCH),
Poitiers Univ. (France). Faculte de Medicine et de Pharmacie.
Jean Brison.
English summary. Revue Internationale D'Oceanographie Medicale, Vol 17, p 127-244, 1970. 15 ref.

Descriptors: *Seashores, *Water pollution abatement, *Water pollution control, Outlets, Bacteria, Self-purification, Public health.
Identifiers: *Population explosion.

Pollution of the seashore by bacteria, virus and parasites is well established. The increase of population and the demographic growth have been found to follow a parallel curve. The phenomena or natural self-purification is no longer possible with the volume of pollution in today's environment. The consequences and long term effects of this constant contamination are not yet fully determined. The author feels it should be recognized that the situation has become alarming and cooperation from everyone is needed. Accent should be placed first on prevention and then on control. (Ensign-PAI)

ANTIBACTERIAL SUBSTANCES PRODUCED BY MARINE BACTERIA (IN FRENCH),
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Gauthier.
English and French Summaries. Revue Internationale D'Oceanographie Medicale, Vol 17, p 23-45, 1970. 3 tab, 5 graph, 22 ref.

Descriptors: *Marine bacteria, *Pseudomonas, *Biodegradation, *Self-purification, Water pollution effects.
Identifiers: Antibacterial substances, Lipo-Polysaccharides, Chromobacterium.

The antibiotic products synthesized by some marine bacteria were studied bacteriologically and biochemically. The activity of several strains of chromobacterium and the lipo-polysaccharides discharged in the culture media are investigated. Self purification or the endogenous microbial antagonism of these products is discussed. (Ensign-PAI)
W71-06203

STUDY OF THE INFLUENCE OF BDELLORIBRIO BACTERIOROUS IN MARINE SELF-PURIFICATION (IN FRENCH),
S. Daniel.
French and English Summaries. Revue Internationale d'Oceanographie Medicale, Vol 15, No 16, p 61-102, 1969. 17 fig, 12 tab, 35 ref.

Descriptors: *Microorganisms, *Bacteria, *Parasitism, *Self-purification, Water pollution effects.
Identifiers: Bdellovibrio bacteriovorus.

Action of the microorganisms and bacterial parasites in the phenomena of marine purification is evaluated. Bdellovibrio bacteriovorus are located in rivers and polluted areas near the seashore. Their presence in the marine environment is associated with the bacterial pollutants that they parasitize and they are sensitive to the antibacterial properties in seawater. (Ensign-PAI)
W71-06204

POSSIBILITY OF STUDYING THE EFFECTS OF POLLUTION ON BENTHIC ORGANISMS EMPLOYING IMMERSED PANELS (IN FRENCH),
Centro di Studio sulla Corrosione Marina dei Metalli, Genoa (Italy).
G. Relini, Oliva Dabini, and L. Ferretti.
English summary. Revue Internationale D'Oceanographie Medicale, Vol 17, p 189-199, 1970. 2 tab, 2 fig, 20 ref.

Descriptors: *Water pollution, *Pollutants, *Benthos, *Fouling, Water pollution effects.
Identifiers: *Asbestos panel method, Genoa Harbour.

Hydrological and biological investigations were conducted in several areas of Genoa harbour subjected to different types of pollution. Relationships between fouling organisms and pollution were studied with asbestos panels immerged at the various experimental stations. (Ensign-PAI)
W71-06205

THE OCCURRENCE OF POLYCYCLIC AROMATIC CARBOHYDRATES IN COASTAL WATERS AND ITS POSSIBLE EFFECTS ON MAN'S HEALTH (IN GERMAN),
M. J. Suess.
English, French, German and Spanish Summaries. Archiv fuer Hygiene und Bakteriologie, Vol 154, No 1, p 1-7, June 1970, Italy, October 2, 1969. 4 tab, 46 ref.

Descriptors: *Oil wastes, *Distribution, *Aquatic life, Water pollution effects, Public health.
Identifiers: *Carcinogenic polyciclic aromatic hydrocarbons.

Carcinogenic polyciclic aromatic hydrocarbons (PAH) are distributed widely throughout the world and are found in coastal waters near heavily populated areas as well as remote unpopulated sites. Endogenic synthesis of flora appears to be a major contributor. Concentrations of PAH in estuaries and coastal waters may be increased by industrial and municipal wastes and atmospheric precipitation. The concentration of carcinogenic PAH in marine fauna used for human consumption was pointed out. However, no definite evidence exists that wastes polluting our seafood is an actual cancer threat to the general public. These possibilities, it is suggested, should not be overlooked in order to prevent possible complication in the future. (Ensign-PAI)
W71-06207

ANTIBACTERIAL ACTIVITY OF A MARINE DIATOM ASTERIONELLA NOTATA (GRUN) (IN FRENCH),
M. Gauthier.
English and French Summaries. Revue Internationale d'Oceanographic Medicale, Vol 15, No 16, p 103-171, 1969. 17 fig, 23 tab, 77 ref.

Descriptors: Water pollution control, *Microorganisms, *Diatoms, Water pollution effects.
Identifiers: *Asterionella notata, *Cellular extract.

Asterionella notata Grun were investigated in solid media and liquid media. Properties of the cultures and antibiosis of the diatom was studied. The cellular extract of this marine micro-algae was found to be specific against many aerobic terrestrial saprophyte, some marine bacteria, fungi and yeasts. This cellular extract's active substance is secreted by the algae in its own culture media and may be able to fight -in situ- against the terrestrial polluting bacterial flora. (Ensign-PAI)

SOME FACTORS INFLUENCING TOXICITY OF LINEAR ALKYLATE SULFONATE (LAS) TO THE BLUEGILL,
National Water Quality Lab., Duluth, Minn.
Kenneth E. F. Hokanson, and Lloyd L. Smith, Jr.
Transactions of the American Fisheries Society, Vol 1, No 1, p 1-12, January 1971. 3 fig, 10 tab, 22 ref. Paper No 6880, Scientific Journal Series, Minn. Agricultural Experiment Station, St. Paul, MN.

Descriptors: *Linear alkylate sulfonate, *Water pollution effects, *Bluegill, *Life history studies, *Bioassay, Lethal limit, Detergents, Hardness (Water), Oil, Water temperature, Dissolved oxygen, Toxicity, Surfactants, *Water quality.
Identifiers: *Mississippi River, Lethal threshold concentration, Application factor, Bentonite suspensions.

Some factors influencing toxicity of linear alklate sulfonate (LAS) on the early life history stages of the bluegill, Lepomis macrochirus (Rafinesque), were studied in raw Mississippi River water under ambient conditions and under controlled conditions in well water. Median response varied from 0.2-10 mg/l LAS with the life history phase and environmental conditions. Variation in estimation of TLm values within and between similar tests was small in comparison to the influence of external factors. The most important environmental factors related to lethal threshold concentration of LAS were dissolved oxygen, water hardness, and acclimation to LAS. High temperature decreased the median tolerance limit only during tests of short exposure. Sublethal concentrations of LAS increased toxicity of fuel oil mixtures while bentonite suspensions up to 200 mg/l had little influence on LAS toxicity. The most sensitive stage of development was the feeding sac-fry, while the most tolerant stage was the newly hatched sac-fry. Eggs and fingerlings had similar intermediate tolerance limits. Egg fertilization was the least inhibited of the events studied. A concentration of 1 mg/l LAS is considered to be a first approximation of a safe concentration for bluegills in Mississippi River water of good quality.

MARINE WASTE DISPOSAL AND SEA URCHIN ECOLOGY,
California Inst. of Tech, Pasadena.
John S. Pearse, Mary E. Clark, David L. Leighton, Charles T. Mitchell, and Wheeler J. North.
June 1970. 93 p, 8 tab, 32 fig, 21 ref. FWQA Program 18050 DNV.

Descriptors: Water pollution effects, Waste disposal, California, Outlets, *Plankton, *Nutrients, *Dissolved solids.
Identifiers: *Sea urchins, Kelp beds, Nutrient assimilation, Leptopel.

Between 1940 and 1960, certain kelp beds near submarine sewer outfalls in southern California deteriorated seriously. Dense urchin ponulations were observed destroying plants and preventing floral restoration. Economic losses totalled many millions of dollars. Possibly wastes nourish urchins and promote kelp bed deterioration by enhancing urchin survival. Our laboratory studies established

four potential nutritional pathways: (1) Urchins can absorb and assimilate dissolved organics. (2) Deposited organic-rich films (leptopel) can be eaten. (3) Larger plankton can be captured and eaten. (4) Microplankton and colloids can probably be assimilated. Outfalls probably contribute significantly to these pathways. Dissolved free amino acid concentrations were over 50 percent higher near an outfall vs. a control area. Leptopel deposits are always conspicuous near outfalls but elsewhere are often undetectable. High turbidities from suspensoids are characteristic of waste dispersal areas. Young urchins from barren outfall areas displayed about half the growth rates measured in well-fed laboratory animals. Barren outfall areas had higher proportions of large urchins compared to barren control areas. Proximity to an outfall ensured relatively high and constant nutritional condition (as measured by gonadal index). Compared to urchins in similar control areas, populations near outfalls were better nourished.

LACTIC AND PYRUVIC ACID CHANGES IN BLUEGILL SUNFISH (LEPOMIS MACROCHIRUS RAFINESQUE) DURING GRADUAL HYPOXIA AT TWO ACCLIMATION TEMPERATURES (5 and 20C),
Virginia Polytechnic Inst., Blacksburg.
Dennis T. Burton.
The ASB Bulletin, Vol 17, No 2, p 35, April 1970.

Descriptors: *Fish physiology, *Acclimatization, *Animal metabolism, Sunfishes, Oxygenation, Oxygen requirements, Anaerobic conditions, Laboratory tests, Dissolved oxygen, Stress, Thermal stress.
Identifiers: *Lactic acid, *Pyruvic acid, *Hypoxia.

Changes in skeletal muscle and liver lactate and pyruvate concentrations during the development of hypoxia were studied at two acclimation temperatures, 5 and 20C. Experimental fish were exposed to a gradual eight-hour hypoxic stress. At both acclimation temperatures lactic acid increased in both muscle and liver at very low oxygen concentrations; the pyruvic acid concentration was relatively constant. Thus the lactate/pyruvate ratio increased at low oxygen concentrations. Lactic acid was higher at 20C than at 5C. Pyruvic acid concentrations were similar at both temperatures. Fish at 5C could tolerate lower oxygen concentrations than those at 20C, thus suggesting that acclimation to cold temperatures has survival value for fish exposed to hypoxia. (Sjolseth-Washington)

THE INFLUENCE OF ACCLIMATION TEMPERATURE ON THE LIPID COMPOSITION OF FISH GILL MITOCHONDRIA,
Duke Univ., Beaufort, N.C. Marine Lab.
Richard S. Caldwell, and F. John Vernberg.
Comp Biochem Physiol, Vol 34, p 179-191, 1970. 3 tab, 1 fig, 48 ref. NSF Grant G-17669.

Descriptors: *Acclimatization, *Fish physiology, *Lipids, *Biochemistry, Water pollution effects, Water temperature, Environmental effects, Gas chromatography, Animal metabolism, Bullheads, Thermal stress, Mode of action, Biological membranes
Identifiers: *Phospholipids, *Fish gill mitochondria, *Fatty acids, *Thermal acclimation.

The phospholipid fraction of goldfish gill mitochondria contained proportionately more cardiolipin and phosphtidyl ethanolamine and less sphingomyelin at 10C than at 30C but total phospholipid phosphorous levels remained unchanged. The total mitochondrial lipids from both goldfish and yellow bullhead gill tissues were more unsaturated at the colder acclimation temperatures. Generally, the levels of saturated and monounsaturated fatty acids were reduced and polyunsaturated fatty acids were increased in both species at the lower temperature. Changes in mitochondrial lipid composition presumably assist in maintaining a specific molecular organization over a wide range of environmental temperatures. (Sjolseth-Washington)

A POTENTIAL CONTROL FOR LEECHES,
Bureau of Sport Fisheries and Wildlife, Stuttgart, Ark. Fish Farming Experiment Station.
Fred P. Meyer.
The Progressive Fish Culturist, Vol 32, p 160-163, July 1970. 16 ref, 1 tab.

Descriptors: *Fish parasites, *Bioassay, *Toxicity, *Evaluation, Chemcontrol, Fish management, Organophosphorous pesticides, Carbamate pesticides, Fish hatcheries, Fishkill.
Identifiers: *Leeches, *Dylox, *Baygon, *Baytex, Placobdella parasitica, Erpobdella punctata, Illinobdella moorei, Piscicola salmositica, Theromyzon.

Leeches pose a large problem in fish hatcheries as they have been responsible for numerous fish losses. Controls for leeches are generally unknown. The purpose of this study was to determine the toxicity of Dylox, Baytex (organophosphorous pesticides) and Baygon (a carbamate pesticide) to five species of leeches; Erpobdella punctata, Illinobdella moorei, Pisciocola salmositica, Placobdella parasitica and Theromyzon sp. All three insecticides affected the leeches but only Dylox, at levels of 0.25 ppm and above, appeared to cause permanent damage to all species. The author feels that Dylox has potential as a control agent for leeches and merits further study. (Sjolseth-Washington)
W71-06322

SOME EFFECTS OF ANTIMYCIN IN AN OLIGOTROPHIC LAKE,
Idaho Univ., Moscow. Dept. of Biological Sciences.
Fred W. Rabe, and Robert C. Wissmar.
The Progressive Fish-Culturist, Vol 31, p 163, July 1969.

Descriptors: *Antimycin-A, *Toxicity, *Fishkill, *Fish food organisms, *Zooplankton, Fish toxins, Fish control agents, Fish management, Benthic fauna, On-site investigations, Daphnia, Cutthroat trout, Idaho, Water pollution effects, Lakes.
Identifiers: *Copper Lake (Idaho), Tin Lake (Idaho).

Antimycin A was applied to Copper Lake in Idaho at a rate of 5 parts per billion. Within 24 hr there occurred a total fish kill of 282 cutthroat trout. Ten days after the poisoning, a sample of six 1-inch cutthroat exposed to the water died within 12 hr. A year before this treatment, plankton hauls in Copper Lake and in nearby Tin Lake had provided counts of 31 and 33 microcrustaceans per liter respectively. Thirteen days after poisoning, no living crustaceans were found in Copper Lake samples, but 82 per liter were found in Tin Lake samples. A year after poisoning Copper and Tin Lakes yielded 25 and 43 microcrustaceans per liter respectively. (Sjolseth-Washington)
W71-06323

METABOLISM OF QUINALDINE (2-METHYLQUINOLINE). UPTAKE AND EXCRETION BY NURSE SHARKS,
National Inst. of Neurological Disease and Stroke, Bethesda, Md. Lab. of Neurochemistry.
Eberhard G. Trams, and Elise A. B. Brown.
Life Sciences, Vol 9, Part 2, p 27-35, 1970. 3 fig, 1 tab, 7 ref.

Descriptors: *Sharks, *Quinaldine, *Excretion, Kinetics, Water pollution effects, *Metabolism, *Absorption, Fish physiology.
Identifiers: Nurse sharks, Sheepshead, Cow-nosed rays.

The studies demonstrated that the uptake and excretion of quinaldine in the nurse shark appear to follow certain rules of kinetics. It was assumed that the rate of uptake and excretion in the experiments was partially dependent on the transport limits of the gills. It was thought conceivable that the lipophilic drug may be absorbed and excreted, in part, by the skin. The preliminary observations on the tissue distribution of quinaldine showed appreciable concentrations in the central nervous system. Quinaldine should become a valuable drug for the handling of a variety of fish. (Wahtola-Washington)
W71-06324

EFFECTS OF ALKYL BENZENE SULFONATE ON RAINBOW TROUT,
Utah State Univ., Logan. Dept. of Wildlife Resources.
T. J. Hassler, J. M. Neuhold, and W. F. Sigler.
U.S. Department of the Interior, Bureau of Sport Fisheries and Wildlife, Technical Papers No 16, 1967. 15 p, 6 fig, 6 tab, 31 ref.

Descriptors: *Alkylbenzene sulfonates, *Rainbow trout, *Detergents, *Bioassay, Toxicity, Mortality, Laboratory equipment, Tracers, *Fish physiology, Fish behavior, *Respiration, Lethal limit.
Identifiers: *LC-50, Hematocrits, Leucocytes, Mucous cells, Sulfur-35.

The effects of alkyl benzene sulfonate on rainbow trout, Salmo gairdneri, were described. Toxicity of detergent levels was determined by probit analysis. Effects on gill tissues and blood were noted and measured. The LC-50 was 3.48 mg/liter ABS after 24 hr exposure, and 2.53 mg/liter after 120 hr. Initial increase in respiratory rate was followed by loss of equilibrium, violent and erratic swimming, lethargy and death. Microhematocrit values, circulating red blood cells, total plasma proteins, leukocytes, and the number of mucus cells on the gill filament tips increased as ABS concentration increased, and decreased with time. Destruction of gill tissues was severe. The respiratory surface was greatly reduced by lysis and clumping of the lamellae. Edema in the epithelial cells of the lamellae and thrombi in the capillaries were evident. (Wahtola-Washington)
W71-06325

A PRELIMINARY STUDY OF THE FEEDING RELATIONSHIPS OF FISH IN A HARD-WATER AND A SOFT-WATER STREAM IN SOUTHERN ENGLAND,
Freshwater Biological Association, Wareham, (England). River Lab.
R. H. K. Mann, and D. R. O. Orr.
Journal of Fisheries Biology, Vol 1, p 31-44, 1969. 6 fig, 5 tab, 24 ref.

Descriptors: *Food habits, Statistics, Fish populations, Aquatic insects, Seasonal, Water pollution effects, *Trout, *Salmon, *Bullheads, *Minnows, Hydrogen ion concentration, Alkalinity, Conductivity, *Hardness (Water), Fish physiology.
Identifiers: Soft water.

The feeding relationships of fish in hard-water and soft-water streams in southern England are reported. The results can be summarized as follows: (1) the food of trout, salmon, bullheads, minnows and sticklebacks from a chalk stream, and trout and minnows from an acid stream were investigated by examination of 2659 stomachs collected between October, 1965 and September 1967, (2) although fish at each stream feed on similar invertebrate organisms, they do so in different proportions and these proportions may vary with the size of the fish, species of fish, season and type of habitat, (3) variation in fish diets within samples is often greater than between successive monthly samples, and (4) Docken's Water trout eat more Plecoptera nymphs and Gammarus than Bere Stream trout, but less Ephemeroptera nymphs and molluscs. (Wahtola-Washington)

CHEMISTRY AND METABOLISM OF INSECTICIDES,
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
Paul A. Dahm.
Journal Paper No. J-6509 of the Iowa Agriculture and Home Economics Experiment Station, Ames, Iowa. Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter II, p 167-182. 6 fig, 1 tab, 62 ref.

Descriptors: *Insecticides, *DDT, *Aldrin, Dieldrin, Insects, Carbamate pesticides, Insect control, Metabolism, Organophosphorus pesticides, Chlorinated hydrocarbon pesticides, Pesticide toxicity, Pesticide residues.
Identifiers: Toxaphene, Parathion, Malathion, Carbaryl, Metabolites, Arthropods.

Insecticides occur in the environment because of purposive applications for pest control and because of accidents and carelessness. The major problems with insecticides arise from the contamination of the environment and food and the development of resistant arthropod-pest populations. The persistence of insecticides in the atmosphere, water, soil, plants, animals, and microorganisms is being investigated. Alterations of insecticides occur under both metabolic and nonmetabolic conditions. Knowledge of the metabolism of insecticides is prerequisite to their development and use for insect control. Identification and toxicological assessment of the metabolic products should precede establishment of residue and other safety factors. More basically, metabolism studies of insecticides reveal intoxication and detoxication processes and how these relate to physiological effects and problems of resistance. With some insecticides, primary metabolic attack may form compounds whose toxicity approximately equals or is greater than the parent insecticide. Numerous nonmetabolic factors exert effects on the structure and persistence of insecticides. The solubilities of insecticides in soil and water are especially important in relation to their movement and persistence in the environment. (See also W71-05437) (White-Iowa State)

EFFECTS OF AGRICULTURAL POLLUTION ON EUTROPHICATION,
Wisconsin Univ., Madison. Dept. of Sanitary Engineering, and Wisconsin Univ., Madison. Dept. of Water Chemistry.
D. E. Armstrong, and G. A. Rohlich.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 23, p 314-330. 14 tab, 2 fig, 26 ref.

Descriptors: *Eutrophication, *Nitrogen, *Phosphorus, Nutrients, Algae, Nitrates, Surface runoff, Base flow, Percolation, Leaching, Drainage, Farm wastes, Soil management, groundwater, Wisconsin, Water supply.
Identifiers: *Agricultural drainage, Lake metabolism, Mobility, Particulate form, Feedlots, Nutrient sources.

The paper discusses nitrogen and phosphorus transport in agricultural drainage since these are the most important nturients involved in eutrophication. It is generally expected that inorganic nitrogen is transported mainly as nitrate by percolating water, although the amounts of ammonium and nitrate carried in runoff waters may be highly significant in terms of the receiving water. Similarly, the largest amount of phosphorus is likely transported in particulate form in runoff waters, but the amount of dissolved phosphorus in runoff water may be of equal or greater importance even though lower in quantity. The contribution of agricultural drainage to the nitrogen and phosphorus status of waters is next examined. The data presented suggest that agricultural land is an important contributor of nitrogen and phosphorus to water. About 60% of the nitrogen and 42% of the phosphorus were estimated to come from agricultural land. Nutrient budget estimations were based on data obtained on a small scale and extrapolated and thus have a low reliability. Nutrient sources are numerous and generalizations as to which source is the most important cannot be made. The contribution of agriculture should be reduced by improved and more efficient agricultural management practices. (See also W71-05437) (White-Iowa State)
W71-06443

EFFECTS OF AGRICULTURAL POLLUTANTS ON RECREATIONAL USES OF SURFACE WATERS,
Missouri Univ., Columbia. Dept. of Zoology; and Missouri Dept. of Conservation, Columbia.
Robert S. Campbell, and James R. Whitley.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 24, p 331-343. 3 tab, 1 fig, 43 ref.

Descriptors: *Pollutants, *Recreation, Lakes, Streams, Algae, Pesticides, DDT, Return flow, Sediments, Soil erosion, Fertilizers, Farm wastes, Fish, Fish eggs, Turbidity, Nutrients, Dissolved oxygen, Nitrogen, Phosphorus, Water Quality Act, Water quality.

Unquestionably many agricultural pollutants affect recreation through alteration of water quality and degradation of fish and aquatic life. The more serious polluting agents are eroded soil, agricultural fertilizers, animal wastes, and pesticides. While the problems relating to agricultural pollution are complex, and the solutions will not easily be attained, it seems reasonable that in many instances alternative procedures can be developed. Pollution control measures are available which will allow continuation of agricultural production and enhance and protect water quality and recreation. While these procedures may be costly to apply, the expenditure should be judged in light of its contribution toward the preservation of man's environment. Especially in the instance of pesticide use, protection of water quality may be requisite to protection of the health of man from unknown long-term effects of pesticides. Reduction and control of agricultural pollutants are essential to develop and maintain a high quality environment. Quality of life and quality of environment are synonymous. (See also W71-05437) (White-Iowa State)

EFFECT OF SOIL TEMPERATURE ON THE AVAILABILITY OF PHOSPHORUS IN ANIMAL MANURES,
California Univ., Davis.
J. L. Abbott, and J. C. Lingle.
Soil Science, Vol 105, No 3, p 145-152, 1968. 3 tab, 5 fig, 14 ref.

Descriptors: *Farm wastes, *Phosphorus, Water pollution effects, Nutrients, Organic matter, Nitrogen, Carbon dioxide, Soil temperature, Plant growth.
Identifiers: *Animal manure, Available phosphorus, Plant response.

Steer, dairy, sheep, and poultry manures, and alfalfa supplemented with monocalcium phosphate added to two slightly acid soils at the rate of 50 ppm. total P and supplied plant-available P to two successive crops - turnips and tomatoes. Dry-weight yield and total P in the tissues provided data for evaluating plant-available P in the manures. In the Sierra sandy loam at the medium soil temperature, uptake of P by turnips was greater from the sheep, poultry, and alfalfa plus PO4 treatments than from the dairy manure treatment. In the Gridley clay loam at 15 deg C. soil temperature, uptake of P by turnips was greater from the poultry manure treatment than from the other treatments. Soil temperature had no measurable effect on the availability of manurial P to tomatoes. At all soil temperatures, P-solubilizing processes, including mineralization of the organic P in both soils and amendments, appeared to contribute to the P absorbed by plants. These processes appeared to continue during the second cropping period, notably at the low (20 deg C.) soil temperature, after having been previously cropped for 5 weeks and incubated for 3 weeks at 15 deg C. Manures yielded more available P in the Sierra than in the Gridley soil. From these data, the HOAc-soluble:nonsoluble P ratios of manures could not be said to have influenced the availability of manurial P to plants. On an equal dry-weight basis, the overall effectiveness of manures in supplying available P depended on their respective total P contents: poultrySsheepSsteer — dairy. (Christenbury-Iowa State)

5D. Waste Treatment Processes

RECOVERY OF URANIUM FROM NATURAL MINE WATERS BY COUNTERCURRENT ION EXCHANGE,
Bureau of Mines, Salt Lake City, Utah. Salt Lake City Metallurgy Research Center.
J. R. Ross, and D. R. George.
Bureau of Mines Report of Investigations RI-7471, January 1971. 17 p, 11 fig, 1 tab.

Descriptors: *Ion exchange, *Uranium radioisotopes, *Leaching, *Mine water, *Mine drainage, Mine wastes, Separation techniques, Resins, New Mexico, Waste water treatment.
Identifiers: *Uranium recovery.

Recovery of uranium from slightly alkaline mine water, available in the Ambrosia Lake district of New Mexico, was studied using countercurrent ion exchange columns. Approximately 5 million gallons of mine water containing 9 to 12 ppm U was treated by ion exchange. Uranium recoveries averaged in excess of 98 percent at solution flows ranging from 15 to 25 gallons per square foot per minute and resin loadings up to 3.6 pounds to U per cubic foot. Loaded resin was continuously eluted in a countercurrent elution column with a diameter of 4 inches and containing a bed of resin 9 feet deep. The resin was eluted to a residual loading of less than 0.06 pound of U per cubic foot, at a resin-retention time of 224 minutes, using only 1.9 volumes of 1.1 M NaCHO3 solution per volume of resin. Compared with existing ion exchange practices for recovering uranium from mine waters in the Ambrosia Lake district of New Mexico, use of these improved ion exchange contactors would reduce ion exchange resin requirements at least 70 percent. (Knapp-USGS)

NORTH SIDE TREATMENT PLANT CHLORINATION,
Metropolitan Sanitary District of Greater Chicago, Ill. Dept. of Research and Control.
Jeanne Johnson.
Metropolitan Sanitary District of Greater Chicago, Dec 20, 1968. 20 p, 7 fig, 2 tab, 3 ref.

Descriptors: *Chlorination, *Waste water, *Sewage effluents, *Waste water treatment, *Sewage treatment, Water pollution treatment, Bacteria, Scum, Coliforms, Illinois.
Identifiers: *Chicago (Illinois), *Chlorine dosage.

The report summarizes field observations and tests of the results of chlorination at the District's North Side Treatment Plant, made in 1968. The results of using the North Shore Channel as a partial contact chamber are discussed including the method of using an interpolated count in lieu of an actual count at the 30 minute contact point. Correlations between chlorine dosages, chlorine residuals and bacterial densities are presented, and the most practical and effective dosage as well as how the meeting of SWB-15 requirements should be evaluated is suggested. It was concluded that if the North Shore Channel is to be used as a partial contact chamber, it is valid to interpolate a bacterial count for the 30 minute point only when no stormwater is being discharged in the sampling area, and when sufficient replicate samples are taken to arrive at a meaningful average bacterial density. It was found to be more practical to use a single chlorine dosage based on plant flow, as is presently practiced at the Northside Plant, rather than chlorine residual control. The dosage found to meet SWB-15 requirements at the outfall 100% of the time sampled was 1.25 p.p.m. The next lowest dosage used, 1.00 p.p.m., did not meet requirements 100% of the time even with the contact time extended to 30 minutes. The scum condition on the North Shore Channel experienced during chlorination appears to be caused by grease coming from the plant. (Poertner)

PHOSPHATE REMOVAL FORM TERTIARY EFFLUENT WITH ION EXCHANGE MATERIALS,
Metropolitan Sanitary District of Greater Chicago, Ill.
Howard Stethers.
Metropolitan Sanitary District of Greater Chicago, January 22, 1968. 26 p, 15 fig, 1 tab.

Descriptors: *Phosphates, *Phosphorus, *Ion exchange, *Tertiary treatment, *Waste water treatment, Pilot plants, Demineralization, Water chemistry, Anion exchange, Water quality, Water quality control, Water purification, Water pollution treatment, Laboratory tests, Illinois.
Identifiers: *Activated alumina, *Anion exchange resins

The tertiary treatment facilities at the District's Hanover Plant are expected to yield an effluent high in phosphate and low in nitrogen content. Chemical methods were studied for removing the phosphates without increasing the content of other anions to determine the better methods for bench scale testing. The ion exchange process was the only one investigated on a bench scale because the process costs and technology of this method offered an acceptable solution to the removal of phosphates from the effluent. The most important result obtained in these experiments was to show that activated alumina selectively removes phosphates from solutions that contain phosphates, sulfates and chlorides. The following conclusions were drawn from the study (1) either anion exchange resins or activated alumina may be used to remove phosphates from the effluent, (2) the best anion resin was that supplied by Illinois Water Treatment Company under the designation A-324-C, (3) the best activated alumina was the chromatographic grades, however, the cost will eliminate these materials for production use; (4) activated alumina pellets gave very acceptable results and do not appear to be too expensive; (5) activated alumina chips give a good removal rate for phosphate and are the cheapest material tested. The investigator recommended that an automatically operated pilot plant having an ion exchange column of about 15,000 gal./day capacity be built to study recycle times and the resistance of activated alumina particles to size degradation. FE CL3 ADDITION EXPERIMENTS FOR IMPROVED EFFLUENT QUALITY AT THE CALUMET TREATMENT PLANT, INTERIM REPORT,
Metropolitan Sanitary District of Greater Chicago, Ill. Research and Development Lab.
Clark L. Weddle, and George R. Richardson.
Metropolitan Sanitary District of Greater Chicago, May 9, 1969. 41 p, 14 fig.

Descriptors: *Sewage effluents, *Waste water, *Sewage treatment, *Waste water treatment, *Flocculation, *Coagulation, Settling velocity, Sedimentation rates, Suspension, Chemical precipitation, Bacteria, Water pollution treatment, Illinois.
Identifiers: *Ferric chloride, Organic polymer, Coagulation aids, Calumet (Illinois).

The Calumet Research Project was started as a result of an unsatisfactory effluent quality observed during the end of December, 1968, and January and February, 1969. Microscopic examination of the solid material in the effluent revealed that this material was small, highly dispersed, bacterial floc which settled very poorly. It was therefore proposed that the addition of a coagulant, such as FeCl3, and/or a coagulant aid, such as an organic polymer, may enhance the formation of larger floc particles resulting in better solids separation in the final clarifier and an improved effluent quality. To determine the effectiveness of these chemical additions, a series of laboratory investigations were conducted which indicated that additions of FeCl3 and Hercufloc 814 organic polymer would reduce the effluent suspended solids concentration. As a result of these laboratory experiments, an experimental program was established along with necessary plant modifications and plant operation to ascertain the effectiveness of these chemicals on a plant scale basis. The report presents the results of the experiments conducted on the addition FeCl3 to one half of one battery at the Calumet Plant. (Poertner)

FIELD INVESTIGATION OF ENVIRONMENTAL EFFECTS OF COOLING TOWERS FOR LARGE STEAM ELECTRIC PLANTS,
Portland General Electric Co., Oreg. Dept. of Engineering Design.
D. J. Broehl.
April 1, 1968. 28 p.

Descriptors: *Cooling towers, *Fog, *Mist, *Nuclear powerplants, *Environmental effects, *Cooling water, Water vapor, Meteoric water, Environmental engineering, Artificial precipitation, Condensation, Thermal powerplants, Heated water, Heat exchangers.
Identifiers: *Cooling tower effects, *Hyperbolic cooling towers, Steam-electric plants, Heat disposal.

The Portland General Electric Company made field inspections of steam-electric generating plants located in the coal mining region of the Appalachian Mountains. The purpose was to observe possible fogging, misting or icing produced by the operation of cooling towers at these plants. This information was to be used by the company in designing the cooling towers for its Trojan nuclear plant. Four of the plants visited use natural draft hyperbolic cooling towers. They range in height between 325 to 400 feet, and in base diameter from 180 to 400 feet. These towers have a total of 6 1/2 years of operating time in climates having more extreme variations than the Trojan plant site. Vapor plumes from the large natural draft towers do not produce ground level fog, even under the most adverse weather conditions. Plume lengths were found to be less than 400 feet most of the time. Induced draft cooling towers were also found satisfactory for the Trojan plant; however, there is a possibility of substantial ground-level fog within a quarter-mile of the towers. It was estimated that the cooling towers for the Trojan plant will cost between 9 and 12 million dollars and that towers will provide a satisfactory means of heat disposal. (Poertner)

DETERMINATION OF THE BIODEGRADABILITY OF ANIONIC SYNTHETIC SURFACE ACTIVE AGENTS.
Organisation for Economic Co-Operation and Development, Paris (France).

Organisation for Economic Co-Operation and Development, Paris, No 78.728, 1970. 30 p, 4 fig, 1 append.

Descriptors: *Detergents, *Biodegradation, *Test procedures, Sewage treatment, Biological treatment, Model studies, Activated sludge, Water pollution sources, Surfactants.
Identifiers: Methylene blue active substances, International test procedures, Detergent industry, Surface active agents.

This report proposes a system of analyses that could predict the biodegradability of anionic surface active agents under conditions of biological sewage treatments. The system comprises two stages: a screening or a static test of the 'open flask' type, based on degradation of methylene blue active substance (MBAS); a confirmatory test simulating biological treatment of sewage in a small version of an activated sludge plant. The latter procedure involves daily determinations of the MBAS concentration in the effluent, the results being expressed in per cent as arithmetic averages for 21 days or for a longer period not exceeding 6 weeks. The proposed system was subjected to trials in 29 laboratories of 13 countries. (Wilde-Wisconsin)

ECOLOGY OF SELECTED BACTERIA IN A SMALL INTERMITTENT SEWAGE POND,
Utah State Univ., Logan. Dept. of Bacteriology.
F. J. Post.
Water Research, Vol 4, p 341-351, 1970. 6 fig, 6 tab, 13 ref.

Descriptors: *Coliforms, *Bacteria, *Oxidation lagoons, Viruses, Pathogenic bacteria, Utah, Waste water treatment, Ecology, Sewage treatment, Analysis, Enteric bacteria, Regression analysis.
Identifiers: Fecal indicators, Logan (Utah), Escherichia coli, Oscillatoria, Beggiatoa, Sphaerotilus natans.

A 24-hour retention sewage oxidation pond in Logan, Utah, had been studied to determine whether a relationship exists between population levels of certain bacteria and selected physical fac-

ors of the environment. When the pond was first illed a biological mat developed predominantly of Oscillatoria type accompanied by Beggiatoa type with sulfur inclusions. A close parallel was found between outlet water temperature and certain groups of special fecal indicators. Fecal enterococci (as measured by the KF method) proved to be he most sensitive to environmental conditions with correlation coefficient to temperature cubed of -).857. Fecal Escherichia coli were also highly sensitive with a correlation coefficient of -0.752, the atter most sensitive of the coliform group as a vhole (-.608). Bacterial antagonism as well as algal ctivity may be significant; other possibilities include bacteriophage, protozoa, and invertebrate oragers. The total count at 20C appears to be an nsensitive indicator of pond activity as it only eflects numerical levels of decomposing bacteria. Knowledge of the casual nature of these changes nay benefit the design of oxidation ponds and unerstanding the role of bacteria in transformation f organic matter. (Jones-Wisconsin)

REATMENT OF FISH HATCHERY EFLUENT FOR RECYCLE,
lew Mexico State Univ., University Park. Dept. of ivil Engineering.
. P. Gigger, Jr., and R. E. Speece.
vailable from NTIS as PB-198 088, $3.00 in aper copy, $0.95 in microfiche. Technical Report umber 67, Engineering Experiment Station, ovember 1970. 119 p, 25 tab, 26 fig, 23 ref. WRR Project A-018-N MEX (3).

escriptors: *Fish hatcheries, *Ammonia, *Filtraon, Turbidity, Nitrogen, Biochemical oxygen deand, Aeration, Filters, New Mexico, Waste water eatment.
lentifiers: *Recycle, Nitrifying bacterial filters, lchesay National Fish Hatchery (N Mex).

he removal of ammonia from fish hatchery efuents using nitrifying bacterial filters was demonrated in pilot plant experiments. The filters used this study showed maximum ammonia removal tes of from 150-200 milligrams of ammoniatrogen per hour per cubic foot of filter and the nmonia removal rates in the filters increased ghtly as flow rates increased. This experiment so showed the effect of water recycle on water uality and the feasibility of using a 100% recycle stem on a large scale at Alchesay National Fish atchery during period when the regular water urce is unsuitable for use due to high turbidity vels. Higher recycle rates caused lower ammonia ncentrations under equilibrium conditions and e additional effects of filtration included removal turbidity and a considerable consumption of oxen in the reduction of carbonaceous BOD. The ualitative behavior of rainbow trout subjected to cycle conditions was observed and it was conuded that when filter size and aeration were equate, fish hatchery effluent could be treated in trifying bacterial filters and recycled without any verse effects on these fish. Mechanical difficules prevented satisfactory operation of the large ale recycle experiment. (Ellis-Texas)

TUDY AND EXPERIMENTS IN WASTE ATER RECLAMATION BY REVERSE OSMOS,
ulf General Atomic Inc., San Diego, Calif.
Nusbaum, J. H. Sleigh, Jr., and S. S. Kremen.
or sale by the Superintendent of Documents, US overnment Printing Office, Washington, DC. 402, Price $1.25. SOD order no 7.13/4:17040.05/10. Available from NTIS as -198 092, $3.00 in paper copy, $0.95 in crofiche. Water Pollution Control Research Ses, 17040-05/70, May 1970. 116 p, 8 tab, 48 fig, 5 f, append. FWQA Program 17040-05/70.

escriptors: *Reverse osmosis, *Brine, *Memanes, Activated sludge, Activated carbon, paration techniques, Acidity, Fouling, Chlorine, Chemical oxygen demand, Waste water treatment, Chemical precipitation, Osmosis, Mebrane processes, Demineralization.
Identifiers: *Flux, Modules, Spacers.

Current reverse osmosis technology was applied to the treatment and demineralization of secondary effluents to determine what operational problems may occur, and develop methods of alleviating them. Two parallel reverse osmosis systems, with 50 ft sq spiral-wound reverse osmosis modules, were operated and results for activated sludge effluent versus activated carbon treated activated sludge effluent were compared. Fouling problems were encountered for which previously developed cleaning techniques were ineffective. An enzyme-based detergent technique was developed which alleviated the problem and restored performance. The size of the brine spacers affected only the pressure drop across the modules, and not the overall performance. Also the quantity of water handled would, over a 3 year period, be substantially more than could be handled by standard flux-high selectivity membranes. (Lowry-Texas)

PROCESS MODELING OF BIOLOGICAL WASTE TREATMENT,
Texas Univ., Austin.
D. M. Himmelblau, and E. F. Gloyna.
Available from NTIS as AD-715 726, $3.00 in paper copy, $0.95 in microfiche. Annual Progress Report no 2, October 10, 1970. 14 p.

Descriptors: *Mathematical models, Aerobic treatment, Biomass, Aeration, Tracer, Waste water treatment.
Identifiers: *Population balance techniques, *Mean residence time, *Complete mixing, Pulse injection, Concentration, Sodium-24, Variance, Agitation, Laboratory scale.

Laboratory scale aeration units have been employed to obtain and identify mathematical models of biological waste treatment. Sodium-24 was used as a tracer material since it doesn't affect the physical parameters of the fluid, it doesn't undergo any chemical reactions, and it is easily detectable in small concentrations. Data obtained is highly reproducible if periods of at least 8-10 residence times are used. However, the assumption of complete mixing was found to be applicable only in certain cases. When there wasn't complete mixing, results were not reproducible. (Lowry-Texas)

PORT ELGIN'S OXIDATION DITCH,
Mackay (A.M.) and Associates, Owen Sound (Ontario).
A. M. Mackay.
Water and Pollution Control, Vol 108, No 12, p 32-33, December 1970.

Descriptors: *Biodegradation, Waste water treatment, Rotors, Sludge, Chlorination, Activated sludge, Biochemical oxygen demand, Oxidation, *Oxidation lagoons.
Identifiers: Oxidation ditch, *Resort area, Extended aeration, Contact stabilization, Suspended solids, Ontario, Canada.

Port Elgin, Ontario, Canada, is a resort town with a population which fluctuates from 6,000 in the summer to 1,800 in the winter. When replacement of their waste treatment facilities became imperative, several alternatives, including conventional activated sludge and extended aeration, were investigated. The oxidation ditch plan was chosen. The final treatment system consists of one long and one short ditch, both agitated by large rotors. The long ditch is where most of the work is done, and the small ditch is for reaeration and storage of solids to be returned as needed. The system was built at a total cost of $420,000 and was designed for 8,000 people at a hydraulic loading of 1 MGD. So far, the effluent discharge from the plant has 2.5 mg/l of BOD and less than 7 mg/l of suspended solids. There has been no odor problem. Power cost and maintenance were $200 per month but are expected to rise to $270 per month, with total operational cost including chlorine then being $560 per month. (Lowry-Texas)

FILAMENTOUS MICROORGANISMS AND THE BULKING OF ACTIVATED SLUDGE,
Rutgers-the State Univ., New Brunswick, N.J. Dept. of Environmental Sciences.
M. S. Finstein, and H. Heukelekian.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, p 175-181, July 1965. 4 fig, 1 tab, 8 ref.

Descriptors: *Microorganisms, *Activated sludge, Waste water treatment, Microbiology.
Identifiers: *Bulking, Sludge volume index.

Quantitative data with which to assess the influence of filamentous microorganisms on the settleability of activated sludges is presented. Flocs from 4 activated sludge plants were characterized with respect to their diameters and total length of associated filamentous microorganisms per floc. Flocs ranged from 0.02-0.2 mm in diameter and 0.0-2.0 mm in length. No consistent relationship was found between floc diameter and SVI but the more filamentous samples invariably had a higher SVI. (Ellis-Texas)

SHEARING EFFECTS ON SETTLING OF ACTIVATED SLUDGE,
California Univ., Davis.
Richard A. Bradley, and Ray B. Krone.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 97, No SA1, p 59-79, February 1971. 9 fig, 1 tab, 24 ref.

Descriptors: *Activated sludge, *Shear, Coagulation, Colloids, Flocculation, Suspensions, Settling velocity, Sedimentation, Waste water treatment.
Identifiers: *Agglomeration, Velocity gradient, Break-up.

Degree of shear in a settling basin was investigated as to its effect on settling of activated sludge. The two main effects of shear are the aggregation of sludge particles and the break-up of such aggregates, and experiments were performed on both conditions. Attempts were made to hold all variables on other than the settling properties and the shear rate constant to preclude changes either in the viscosity or the physical state. All tests were conducted in a bench scale apparatus of approximately 3.0 l capacity. Optimum shearing rate for the activated sludge studied was determined to be 15 per sec, and this amount of shear significantly enhanced the aggregation of activated sludge particles, and their separation by settling from the suspending water. (Lowry-Texas)

FUNDAMENTAL ASPECTS OF SURFACE AERATOR PERFORMANCE AND DESIGN,
Mixing Equipment Co., Rochester, N.Y.
J. R. McWhirter.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, p 75-92, July 1965. 10 fig, 24 ref.

Descriptors: *Aeration, *Oxygen, Oxygenation, Waste water treatment, Mass transfer, Reaeration, Oxidation, Activated sludge.
Identifiers: *Surface aerators.

A comparison of unsteady-state aeration of pure tap water, steady-state aeration of pure tap water, steady-state oxidation of sulfite solution, and steady-state aeration of activated sludge was made to evaluate surface aeration equipment. In testing surface aerators, it is extremely difficult to prevent a concentration gradient from developing in the liquid at the start of the reaeration which causes a

low calculation of the mass transfer coefficient. Proper interpretation of sulphite oxidation data can only be made by taking into account the effect of the rapid sulphite-oxygen uptake on the overall mass transfer rate. Sulphite oxidation data show higher oxygen uptake rates than corresponding steady-state reaeration data in addition to showing a different temperature variation and a significant variation in oxygen uptake rates with different catalysts. The unsteady-state reaeration technique is the most widely used and accepted method of determining the mass transfer coefficients or oxygenation capacity of aeration devices. (Ellis-Texas)

MOISTURE TRANSPORT IN SLUDGE DEWATERING AND DRYING ON SAND BEDS,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
Hsi Tang Ning, K. B. Schnelle, Jr., and F. L. Parker.
Technical Report No 18, 1969. 198 p, 19 tab, 68 fig, 20 ref, 4 append. FWQA Program 17070 DIV.

Descriptors: *Moisture content, *Sludge, *Dewatering, Gamma rays, Attenuation, Sludge disposal, Waste water treatment, Chemical precipitation.
Identifiers: *Sand beds.

The specific aim of this study is as follows: (1) to determine the moisture content in the sludge layer as well as in the sand layer by the gamma-ray attenuation technique; (2) determine the drainage characteristics of sludge having various initial depths; (3) determine the effects of evaporation from the sludge surface on the drainage process of the sludge; (4) to study the moisture transport phenomenon both in the sludge cake and in the sand beds under various conditions; and (5) to study the effect of sludge with chemical conditioners on the dewatering rate on sand beds. The gamma-ray attenuation technique can be used to determine the moisture content of the sand layers but determination of sludge moisture leaves much to be desired. The weight difference method was shown to be an acceptable way to measure the average moisture content of the sludge. It was shown that the time required to complete the drainage flow of the sludge is a function of the initial sludge depth and the evaporation date and depth of the sand have little effect on the drainage process. The moisture in the sand layer is contained in the bottom 4-5 cm of the sand bed. Chemically conditioned sludges are dewatered considerably faster than are those not chemically conditioned. (Ellis-Texas)

PROCESS OPTIMA IN ACTIVATED SLUDGE,
Illinois Inst. of Tech., Chicago.
S. Polocsik, R. B. Grieves, and W. O. Pipes, Jr.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, p 197-209, July 1965. 5 fig, 1 tab, 4 ref. Public Health Service Training Grant no 5T1ES26-02.

Descriptors: *Activated sludge, *Baffles, *Aeration, Kinetics, Nutrients, Optimization, Waste water treatment.

An effort has been made to analyze the effects upon the activated sludge process of first, baffling the aeration tank to provide three completely-mixed compartments of varying fractional volumes; second, of varying the input distribution of the waste to the three compartments, and third, of varying the recycle flow to the three compartments. Two-phase and one-phase kinetics were employed, with the latter utilized for the case of no sludge recycle. Optimum operation is achieved by dividing the aeration tank volume by baffling into three equal size compartments. It is best to distribute the feed toward the front of the system while the recycle should be inserted toward the back end of the system. (Ellis-Texas)

EVALUATION OF SOME STABILIZATION PONDS IN INDIA,
Central Public Health Engineering Research Inst., Nagpur (India).
R. H. Siddiqi, and B. K. Handa.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 97, No SA1, p 91-100, February 1971. 7 fig, 1 tab, 11 ref.

Descriptors: *Oxidation lagoons, *Aerobic treatment, *Anaerobic conditions, Ponds, Climatic zones, Temperature, Turbulence, Oxygenation, Algae, Photosynthesis, Municipal wastes, Biochemical oxygen demand, Waste water treatment, Microorganisms.
Identifiers: Facultative microorganisms, India.

Climatic conditions in India are favorable to the operation of engineered waste stabilization ponds. Consequently, the treatment of wastes in such ponds is economically competitive with conventional biological treatment. Data collected from several installations in India were analyzed to determine what useful parameters of operation could be identified. Pond loading was found to be best expressed by a load factor, L sub f, which is the ratio of BOD load to algal produced oxygen. For L sub f between .44 and 8.0, the performance was determined from the following equation: E — 100 over (1 .. 0.188 L sub f or explanential to 0.48). From the preceding investigations, it was determined that the majority of organic matter destroyed is destroyed anaerobically. Therefore, ponds of depth greater than 5 feet are more efficient in their operation since there is less turbulence and less change of the anaerobes being exposed to oxygen. It was also determined that single cell reactors, or the first cell of a multi-cell arrangement maintain a higher destruction rate constant, with the rate of BOD reduction being described as a first order equation. The rate drops off with each successive cell in a multi-cell arrangement. (Lowry-Texas)

SOME EFFECTS OF HIGH SALT CONCENTRATIONS ON ACTIVATED SLUDGE,
Oklahoma State Univ., Stillwater. Bioengineering Labs.
D. F. Kincannon, and A. F. Gaudy, Jr.
Proceedings, Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, p 316-328, July 1965. 8 fig, 1 tab, 14 ref.

Descriptors: *Salts, *Activated sludge, Sodium chloride, Waste water treatment, Synthesis, Sludge.
Identifiers: Lysis, Substrate, Shock loading.

In previous experiments it was found that high salt concentrations could cause a severe decrease in the substrate removal rate and that long-term exposure to high salt concentrations caused a significant change in the ratio of respiration to synthesis. In the present study, experiments were designed to gain insight into the causal effects uncovered in the previous investigation, particularly with respect to shock-loading. For sludges developed in fresh water the substrate removal rate decreases at slug doses of 30,000 mg/l Na Cl but does not cause serious distress to the system. However, for mixed liquor concentrations of 45,000 mg/l there is severe impairment of substrate removal efficiency. Sludges grown in high salt concentrations were characterized by low carbohydrate and protein content, and abnormally high lipid and RNA content. When sludges which are acclimated to a high concentration of salt are placed in a fresh water environment, the immediate response involves a release of cellular components indicative of lysis. BIOLOGICAL CONCEPTS AND INDUSTRIAL WASTE DISPOSAL PROBLEMS,
Academy of Natural Sciences of Philadelphia, Pa.
J. Cairns, Jr.
Proceedings Industrial Waste Conference, 20th, May 4, 5, 6, 1965, Purdue University, Vol XLIX, No 4, July 1965, p 49-59, 5 fig, 5 ref.

Descriptors: *Microbiology, *Microorganisms, *Bioassay, Environmental effects, Biota, Aquatic environment, *Industrial wastes, *Waste disposal, Waste water treatment.
Identifiers: Biological monitoring.

A discussion is conducted demonstrating that biological data is as easily assessed as chemical data, that biological data may be presented numerically, and that existing biological concepts could furnish information not now provided by any other system of pollution detection. The three basic needs of any waste disposal design system include: (1) a baseline reference study showing the existing preoperation conditions; (2) a continually operative monitoring system to check short-term effects caused by spills, changes in operating procedures, etc; and (3) a predictive system whereby the effects of a waste might be measured before introducing the waste into the stream itself. (Ellis-Texas)

DEVELOPMENT OF DESIGN PARAMETERS FOR INTERSTATE REST AREA SEWAGE TREATMENT SYSTEMS,
Tennessee Technological Univ., Cookeville. Dept. of Civil Engineering.
Leslie B. Stuart.
Master of Science Thesis, Engineering Research Series, August 1970. 90 p, 17 tab, 12 fig, 22 ref, 2 append.

Descriptors: *Sewage treatment, *Waste water treatment, *Aeration, Tennessee, Treatment facilities, *Highways, Organic loading.
Identifiers: *Interstate highway system, Rest areas, Package treatment plants, *Extended aeration, Hydraulic loading.

A research project was conducted to establish design parameters for application to Interstate Rest Area sewage treatment facilities. This study was conducted at the Smith County Rest Area, located on I-40, Tennessee where the sewage treatment system consists of a 20,000 gpd package-type extended aeration plant installed in February 1969 on recommendation of private consultants. The investigation indicates that current design of Interstate Rest Area sewage treatment systems in Tennessee is much too conservative and uneconomical. The results of this study indicate that hydraulic loading is the critical factor in sizing package-type treatment facilities for Interstate Rest Areas. The Smith County plant was designed on the basis of 10.68 gallons per vehicle (gpv) but tests showed that the actual flow is only 5.52 gpv and the organic loading is only 200 mg/l while it was designed for 240 mg/l. (Ellis-Texas)

STUDY OF MUNICIPAL WASTE WATER RECLAMATION,
Tennessee Technological Univ., Cookeville. Dept. of Civil Engineering.
William B. Willard, Jr.
Master of Science Thesis, August 1970. 202 p, 15 tab, 70 fig, 51 ref, 10 append.

Descriptors: *Municipal water, *Municipal wastes, Water reuse, Waste water treatment, Water treatment, Chemical oxygen demand, Turbidity, Tertiary treatment, Tennessee.
Identifiers: Total suspended solids, Cookeville (Tenn).

Research was conducted to determine the feasibility of municipal waste water reclamation by recycling a city's sewage treatment plant effluent through its water treatment plant. A continuous flow, 3.5 gallon/hour model water treatment plant was designed and constructed using common chemical-physical treatment processes such as screening, chemical coagulation, sedimentation, filtration, and chlorination. Samples of the effluent from the Cookeville, Tennessee, Sewage Treatment Plant were passed through the model and analyzed for turbidity, total suspended matter and chemical oxygen demand. A comparison of analyses of samples taken before, during, and after treatment was made to evaluate the effectiveness of this treatment. This experiment revealed that within the parameters tested, turbidity, TSS, and COD waste water recycle is feasible and can result in an aesthetically attractive domestic water supply which meets USPHS standards for turbidity of water. This process should also be considered as a means of tertiary treatment. (Ellis-Texas)

SURVEY OF DESALTING PROCESSES FOR USE IN WASTE WATER TREATMENT,
Oak Ridge National Lab., Tenn.
I. Spiewak.
In: Proceedings 9th Annual Environmental and Water Resources Engineering Conference, June 4-5, 1970, Nashville, Tennessee, Technical Report No 22, Department of Environmental and Water Resources Engineering, Vanderbilt University, p 153-178. 12 fig, 9 tab, 19 ref. Housing and Urban Development Interagency Agreement No IAA-H-3-69.

Descriptors: *Water treatment, *Waste water treatment, *Desalination processes, Distillation, Electrodialysis, Flash distillation, Ion exchange, Membrane processes, Reverse osmosis, Economics, Tertiary treatment, Demineralization.
Identifiers: Dynamic membrane hyperfiltration, Recycle.

Various processes were surveyed to determine feasible methods to prevent mineral buildup when reuse of waste water is necessitated in the future. A resume of a system of processes for water supply and waste water treatment is included along with desalination techniques available such as electrodialysis, reverse osmosis, dynamic membrane hyperfiltration, and distillation. Economic analyses, which compared systems with and without recycle, indicated that although tertiary waste treatments may increase the cost of sewage processing by factors of up to 4 times the overall cost of treatment and water supply need not be increased over 50%. This analysis excludes the cost of water distribution and sewage collection which are about 20c/1000 gals, but including them would make the difference in cost between conventional practice and complete recycle only about 30%. (Ellis-Texas)

DESIGN CRITERIA FOR MUNICIPAL WASTE WATER TREATMENT PLANTS IN TENNESSEE,
Tennessee Dept. of Public Health, Nashville. Div. of Sanitary Engineering.
J. W. Saucier.
In: Proceedings 9th Annual Environmental and Water Resources Engineering Conference, June 4-5, 1970, Nashville, Tennessee, Technical Report No 22, Department of Environmental and Water Resources Engineering, Vanderbilt University, p 111-130.

Descriptors: *Waste water treatment, *Design standards, *Specifications, *Standards, Permits, Industrial wastes, Sewerage, Pumping plants, Sedimentation, Aeration, Activated sludge, Lagoons, Tertiary treatment, *Tennessee, *Municipal water, *Municipal wastes, *Treatment facilities, Design criteria.

The Tennessee Department of Public Health has been assigned the responsibility of general supervision of construction, operation, and maintenance of all public waste water systems in Tennessee. The Department must review and approve all plans and specifications and to provide guidance in this matter 'Guide Lines for Review of Plans and Specifications for Waste water Treatment Facilities,' has been published. A resume of these guidelines is given for the new standards in Tennessee but for more complete information the basic regulation should be consulted. (Ellis-Texas)

ALTERNATIVES FOR THE TREATMENT AND DISPOSAL OF ANIMAL WASTES,
Cornell Univ., Ithaca, N.Y.
R. C. Loehr.
In: Proceedings 9th Annual Environmental and Water Resources Engineering Conference, June 4-5, 1970, Nashville, Tennessee, Technical Report No 22, Department of Environmental and Water Resources Engineering, Vanderbilt University, p 185-198. 2 fig, 2 tab, 10 ref.

Descriptors: *Farm wastes, *Water disposal, *Waste water treatment, Water pollution sources, Nutrients, Dentrification, Aeration, Nitrification, Nitrogen, Phosphorous, Oxidation, Oxidation lagoons, *Waste disposal, Solid wastes, Liquid wastes.
Identifiers: Oxidation ditches.

Confined animal production has caused new environmental problems for agriculture by producing large volumes of liquid and solid wastes for disposal. The excessive nutrients in animal wastes and waste waters have been noted as a cause of current and potential pollution problems. Technical processes are available that can treat these wastes but there is no one process or waste management system that is adequate for all animal operations. Aeration systems such as oxidation ditches underlying cattlebarns are gaining acceptance among livestock producers for ease of waste handling for odor control, and for treatment of this waste. Of the possible methods to reduce the concentration of nitrogen and phosphorous reaching surface and groundwaters from the disposal of animal waste waters, ammonia release, controlled nitrification and dentification, and crop or land management appear the most feasible. (Ellis-Texas)

SETTLING CHARACTERISTICS OF ACTIVATED SLUDGE AT LOW TEMPERATURE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
Sherwood Reed.
Available from NTIS as AD-717 239, $3.00 in paper copy, $0.95 in microfiche. CRREL Technical Report 203, Nov 1970. 30 p, 17 fig, 5 tab, 25 ref.
Identifiers: *Sewage, *Arctic regions, Chemical precipitation, Mathematical analysis, Design, *Sewage treatment, *Activated sludge process, *Clarification, Settling.

A series of activated sludge settling tests were observed with particle concentration and temperature as the controlled variables. Based on the experimental data, an equation defining settling velocity in terms of concentration, fluid temperature, and organic loading was developed. Although empirical in nature the equation provides a rational basis for the determination of temperature influence and should have special value for cold regions designs. It was possible to describe the results of other investigations with this equation.

FOAM SEPARATION PROCESSES FROM INDUSTRIAL WASTE TREATMENT: PHENOL, PHOSPHATE, AND HEXAVALENT CHROMIUM,
Illinois Inst. of Tech., Chicago. Dept. of Civil Engineering.
R. B. Grieves.
Proceedings, Industrial Waste Conference, May 3, 4, 5, 1966, Purdue University, Vol L, No 2, p 192-202, March 1966. 8 fig, 7 ref. US Public Health Service Research Grant No WP 00702-02.

Descriptors: *Foam separation, *Industrial wastes, *Phenols, Phosphates, Hydrogen ion concentration, Surfactants, Waste water treatment, *Chromium, Metals, Inorganic compounds.
Identifiers: *Hexavalent chromium.

A comparison is made of previous studies of the residual ratios obtained from the batch foam separation of phenolate, orthophosphate, and dichromate, including the effects of pH and of the initial surfactant concentration; and the establishment of the feasibility of multicolumn, continuous ion flotation of dichromate for the removal and recovery of hexavalent chromium. Dichromate was shown to be least influenced by pH, and for a given surfactant concentration, considerably better results were achieved than for phenolate or phosphate. Combining several columns in series, multicolumn performances have been calculated including a four-column unit in which a 100 mg/l dichromate feed can be reduced to 3 mg/l, using 422 mg/l of surfactant. The combined collapsed foam stream contains 444 mg/l of dichromate and 1904 mg/l surfactant. (Ellis-Texas)

THE EFFECT OF CLAY MINERALS ON SURFACTANT BIODEGRADABILITY,
Rutgers-The State Univ., New Brunswick, N.J.
R. D. Barbaro, and J. V. Hunter.
Proceedings of the 20th Industrial Waste Conference, May 4, 5, 6, 1965, Engineering Bulletin of Purdue University, Vol XLIX, No 4, p 189-196, July 1965. 3 fig, 2 tab, 11 ref.

Descriptors: *Clays, *Biodegradation, *Surfactants, Bentonite, Degradation, Biology, Adsorption, Enzymes.
Identifiers: Kaolinite.

A study was made to observe the effect of several clay minerals upon the extent of biological degradation of several representative surfactants and to point the direction for further research in this area. The biological utilization of relatively degradable species of the 3 types of surfactants may be inhibited by small quantities of kaolinite and bentonite. The observed effect may be due to the adsorption and inactivation of substrate or enzymes. No significant effect of clay particles upon the utilization of the relatively nondegradable species of the 3 types of surfactants could be shown by this technique. (Ellis-Texas)

CONTROL OF INFILTRATION IN SEWER SYSTEMS-DESIGN AND MAINTENANCE,
Nashville Metropolitan Government and Davidson County, Tenn. Sewerage Services.
R. Harrington.
Proceedings, 8th Annual Environmental and Water Resources Engineering Conference, June 5-6, 1969, Technical Report No 20, Department of Environment and Water Resources Engineering, Vanderbilt University, p 11-17, (1969).

Descriptors: *Infiltration, *Sewers, Sewage disposal, Specifications, Groundwater movement, Soil water movement, Waste water treatment, Design standards, Materials testing.

The City of Nashville and the County of Davidson merged in 1963 and brought about an evolution in the design, construction, and maintenance of sanitary sewers. New specifications were required to upgrade the outdated standards of yesteryear. Modern technology has allowed a great reduction in the infiltration allowed under these new specifications at a reduction in initial cost. A change in pipe material, stone bedding, precast manholes, precast service connections, and improved stopper have reduced the amount of infiltration into the sewerage of this community. (Ellis-Texas)

HYDRAULIC OVERLOADING-FACT OR FICTION,
Resource Consultants, Inc., Nashville, Tenn.
J. C. North, and H. D. Tomlinson.
Proceedings, 8th Annual Environmental and Water Resources Engineering Conference, June 5-6, 1969, Technical Report No 20, Department of Environment and Water Resources Engineering, Vanderbilt University, p 19-32, (1969). 16 ref.

Descriptors: *Waste water treatment, *Water treatment, Industrial wastes, Waste water disposal, Tertiary treatment, Storm runoff.
Identifiers: *Recycle.

The problem of handling present hydraulic overloading cannot be separated from other considerations of public interest involving water supply, domestic waste treatment, industrial waste treatment, and conservation of natural resources. Excessive flow in a sewer system or a waste treatment plant is a factor which often requires large capital outlays to correct and is partially responsible for the projected millions of dollars needed to update the existing systems. Reuse of treated waste waters is becoming more popular and economical. A brief review of the applicability of general reuse concepts is presented. (Ellis-Texas)
W71-06198

SOME FACTORS TO BE CONSIDERED IN THE DESIGN OF WASTE DISPOSAL WELLS,
Geological Survey, Nashville, Tenn., Water Resources Div.
D. R. Rima.
Proceedings, 8th Annual Environmental and Water Resources Engineering Conference, June 5-6, 1969, Technical Report No 20, Department of Environment and Water Resources Engineering, Vanderbilt University, p 119-127, (1969).

Descriptors: *Injection, *Waste water disposal, *Hydrologic properties, Groundwater recharge, Waste water treatment, Geologic formations, Hydraulic properties, Hydraulic gradients.
Identifiers: Hydrodynamic dispersion.

The hydrologic factors most commonly overlooked in the design of waste injection wells are natural hydraulic gradients and hydrodynamic dispersion within the proposed injection zones. Natural hydraulic gradients are known to exist in porous and permeable formations at depths of several thousands of feet beneath the land surface and exert a strong influence on the direction and rate of movement of liquid wastes in injection zones. Hydrodynamic dispersion results from velocity variations in laminar flow through porous media and can greatly expand the spread of contaminants from an injection well because the width of the envelope of dispersion increases in proportion to the distance traveled by the dispersing contaminant. CONTROL OF WASTES FROM WATER TREATMENT PLANTS,
Virginia State Water Control Board, Richmond.
A. H. Paessler, and E. R. Sutherland.
Proceedings, 8th Annual Environmental And Water Resources Engineering Conference, June 5-6, 1969, Vanderbilt University, Department of Environmental and Water Resources Engineering, p 137-160, (1969). 19 ref.

Descriptors: *Water treatment, *Waste water treatment, *Waste water disposal, *Treatment facilities, Chemical precipitation, Lagoons, Regulation, Abatement.

A staff survey was made of municipal water treatment plants in order to develop criteria for the design of waste treatment facilities for wastes engendered by water treatment. The least expensive method, and most widely used is simple lagooning. Other methods such as sand drying beds, centrifugation, vacuum filtration, treating in sewage works, dilution, and recalcining are other possibilities f the treatment of this sludge. It is evident that t control of water treatment wastes is not depende on technological breakthroughs or massive mon tary investments, but depends primarily upon t determination of regulatory agencies to abate po lution from this source. Gulf South Research Inst., New Iberia, La.
Shirish G. Dholakia, James H. Stone, and Harry P. Burchfield.
Copy available from GPO Sup Doc as EPA-WQO Report No 17010 DHT, August 1970, $0.50; microfiche from NTIS as PB-198 221, $0.95. 38 p, 7 fig, 6 tab, 14 ref. EPA-WQO Contract No 14-12-527.

Descriptors: *Dentrification, *Waste water treatment, *Temperature, Dissolved oxygen, Tertiary treatment, Pilot plants, Chemical reactions, *Water reuse, Nutrients, Eutrophication, Ammonia, Nitrates, Nitrites.
Identifiers: *Methanol requirement, Packed column reactor, Suspended growth reaction.

A pilot-scale, denitrifying plant was built using two types of continuous-flow reactors, a packed column and a suspended growth chamber. Dentrification at three temperature regimes and three dissolved oxygen levels was studied as a function of the methanol:NO3-N ratio. The most efficient ratio was usually found to be between 2:1 and 3:1. Effective dentrification at lower temperatures and high

dissolved oxygen required ratios equal to or slightly greater than 3:1.

Descriptors: *Canneries, *Industrial wastes, *Disinfection, *Screens, *Trickling filters, *Separation techniques, Water pollution control, Waste water treatment.
Identifiers: *pH control, *Peach wastes, Tomato wastes.

Trickling Filter--The effects of hydraulic loading and nutrient addition on soluble B.O.D. removal from fruit waste water were investigated. In 1968, at 1250 gpd/sq ft without nutrient addition, 190 lbs of B.O.D./1000 cu ft/day were removed; with nutrient (anhydrous ammonia) addition, 450 lbs of B.O.D. were removed. At 2200 gpd/sq ft, B.O.D. removal decreased slightly. pH Control--Fruit dumping water was acidified with citric acid and controlled at pH 4.0 or below to inhibit bacterial growth and to extend the use of recirculated water. The daily discharge volume of acidified system was 720 gallons containing 118 lbs of B.O.D.; non-acidified, 26,520 gallons, 170 lbs B.O.D. Air Flotation System--Removal from peach rinse water was 75 to 93 percent at 2700 gpd/sq ft and 1400 gpd/sq ft respectively. A 70 percent removal was maintained at 2300 gpd/sq ft for peach and 1400 gpd/sq ft for tomato waste water. Screens--The maximum capacity of the single (20 mesh) deck was 1000 gpm. Compared to 20 mesh rectangular screen, 48 mesh removed 32.2 percent more solids. For the double deck unit containing a 20 mesh top and 100 mesh bottom, the unit handled 1500 gpm - 1.5 times the single deck unit. (Rose-Nat'l Canners Assoc)

DEVELOPMENT OF NEUTRON ACTIVATION FOR INVESTIGATION OF WATER CLARIFICATION,
Missouri Water Resources Research Center.
Louis Hemphill, and Gary C. Batz.
Available from NTIS as PB-198 235, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Missouri Water Resources Research Center, September 1970. 15 p, 3 tab, 2 fig. OWRR Project A-026 MO (1).

Descriptors: *Coagulation, *Flocculation, Neutron activation analysis, Zeta potential, Waste water treatment, *Water purification, Electrophoresis, Clays.

The objective of this research was to determine if activation analysis could be used to investigate coagulation-flocculation reactions. Experimental study of the coagulation-flocculation reaction was developed by preparing clay-water mixtures using montmorillonite and illite clay samples and a standard ionic solution. Samples of the clay material were subjected to neutron activation for various times and neutron flux values. The irradiated clay samples were blended with stable clay materials and subjected to electrophoresis. Results of this study showed that clay minerals can be activated to a high value by thermal neutron irradiation and that the neutron irradiation can be controlled to increase the yield of specific radionuclides. Experimental results also showed that the clay particle migrated as a integral unit particle during electrophoresis.

SURVEY OF DESALTING PROCESSES FOR USE IN WASTE WATER TREATMENT,
Oak Ridge National Lab., Tenn.
I. Spiewak.
Available from NTIS as ORML-TM-3155, $3.00 in paper copy, $0.95 in microfiche. Report ORNL-TM-3155, September 1970. 30 p, 10 fig, 2 tab, 19 ref. HUD Agreement No IAA-H-3-69.

Descriptors: *Waste water treatment, Water reuse, *Sewage treatment, *Desalination processes, Cost analysis, Costs, Tertiary treatment.

This report is based on one of a series of investigations sponsored by the Department of Housing and Urban Development to determine the benefits which might be gained from urban energy centers. A review is given of processes used for waste water treatment, emphasizing new processes which appear to have potential for combination with desalting. A survey of developmental application of desalting processes to wastes is given. Cost estimates are given for a number of possible systems using desalting to treat effluent from a city of 1 million population. The analysis indicates that, although advanced waste treatments may increase the cost of sewage processing by factors of up to four times, the overall cost of water supply, sewerage and treatment need not be increased over about 30 per cent. It is concluded that desalting is primarily of value in systems which provide reusable product water. Such systems generate waste brines very difficult to dispose of, in many cases, except by distillation to dryness.

SCREEN TREATMENT FOR SEWER OVERFLOWS.

Am City, Vol 84, No 3, p 24, Mar 1969.

Descriptors: *Screens, Storm runoff, Overflow, Oregon.
Identifiers: *Runoff treatment, Combined sewers.

An alternative to separation of combined sewers in Portland, Oregon is being tested under a FWPCA grant. The experimental pilot plant includes high-rate, fine-mesh screens which treat overflow that is pumped to the plant during periods of heavy rainfall. Previously, only one-third of the rainy season flow was treated while the remainder was discharged untreated into a receiving stream. A description of the structure and workings of the screen operation is given. Laboratory tests will determine the effectiveness and feasibility of the system.

CONSTRUCTION COST REQUIREMENTS FOR WATER AND WASTE WATER FACILITIES.

Public Works, Vol 98, No 12, p 112-113, Dec 1967.

Descriptors: *Cost analysis, Waste water treatment.
Identifiers: *Waste water facilities.

The Business Defense Services Aministration surveyed 1200 major water utilities in order to predict the construction cost requirements for water and waste water facilities. The forecasted average annual expenditure over the 14-year period (1967-1980) showed a 139% increase over annual amounts for the past 12 years. These expenses result from the need to remedy present defects, to account for depreciation and obsolescence, and to counter the demands of an increasing population. Data included indicating costs required for various types of water supply and waste water utilities in addition to amounts to be spent to combat individual problems can serve to guide manufacturers in planning future construction.

SOME ASPECTS OF SEWAGE TREATMENT AT COVENTRY,
R. W. Brooks, H. V. Lee, and M. J. Price.
Water Pollution Control, Vol 68, No 2, p 129-145, Mar 1969.

Descriptors: *Sewage treatment, *Sludge treatment, *Filtration, Storm runoff.
Identifiers: *Storm sewage, Storm overflows, Sewer hydraulics, Great Britain.

An historical progress report of Coventry involving the sewage treatment outline development, activated sludge treatment, and sand filtration is presented. In the 1960's, the elimination of direct storm overflows and the provision of regional storm sewage balancing stations was initiated. Excess flow would be diverted to tanks at the stations until available capacity could be made in the sewer downstream and pumps then could automatically return the contents of the tanks. In the reply to the discussion following the article the limits for discharges from the storm overflows are presented.
W71-06366

WATER TREATMENT - A GUIDE TO THE TREATMENT OF WATER AND EFFLUENTS PURIFICATION: CHAPTER 13 - INTRODUCTORY: SEWER SYSTEMS--OVERFLOWS-CONSERVANCY,
G. V. James.
The Technical Press Ltd, London, p 247-252, 1966. 1 fig, 5 ref.

Descriptors: *Sewerage, *Flow characteristics, *Sewers, *Overflow, *Weirs, Sewage treatment.
Identifiers: *Storm overflows.

General facts concerning sewage and sewer systems are presented, including explanations of sewage 'strength'; variations in flow; the influence of seasonal and weather changes; and the three types of sewerage systems--combined, partially separate, and entirely separate. The operation of local storm overflows to relieve tributary sewers before they are surcharged is described. The three types of overflows are: the ordinary weir type; the improved weir type with a horizontal iron plate and a vertical deflecting plate directing water to the overflow pipe; and the leaping weir type, the best of the three sewage treatment processes mentioned include: chemical precipitation; use of comminutors; and dilution, bleaching and trenching of cesspoool contents.
W71-06371

ALTERNATIVES TO SEPARATION OF COMBINED SEWERS,
D. H. Waller.
Paper presented at the 21st Annual Meeting of the American Water Works Association, Atlantic Branch, Canadian Section, Oct 8, 1968.

Descriptors: *Pollution abatement, *Application methods, *Separation techniques, Overflow.
Identifiers: Combined sewers.

The drawbacks of separation include high costs, public inconvenience during construction, and the continuing problem of polluted stormwater runoff. Alternative solutions to this pollution problem either reduce pollutants in the overflow or decrease amounts of combined sewage that is overflowed. Pollutants can be eliminated from overflows through storage and treatment methods such as disinfection, screening, sedimentation, filtration, and other overflow devices. Possible procedures for diminishing combined sewage overflows outlined include real-time control of discharge points, storage by use of larger pipes, or increased interceptor and treatment plant capacity. Each locality's circumstances will determine which method or combination of methods will provide the best means for solving its pollution problem.
W71-06374

A RE-EXAMINATION OF THE STORM TANK PROBLEM,
L. S. Escritt.
Water Waste Treat, Vol 12, No 9, p 298-300, Sep/Oct 1969. 1 tab.

Descriptors: *Sewers, *Overflow, *Treatment facilities, *Design, Sewage treatment.
Identifiers: *Storm tank, *Capacity, *Stormwater treatment.

Where sewage works treat flow from catchments which are served by combined or partially-separate sewers, a moderately intense railfall-runoff rate will necessitate passage or storm-tank storage of excess flow. The Royal Commission on Sewage Disposal makes recommendations regarding the handling of such overflows. The author of this paper disputes their statement that storm tanks able to hold one-quarter of the daily dry-weather flow will suffice for storing spill-over from small storms. He notes that a capacity of two days dry-weather flow is often needed to prevent spill-over occurring. Functions of storm tanks and the mathematics of stormwater treatment are described. A suggested design for tanks consists of circular tanks with rotating sludge mechanisms. A formula for calculating the required capacity of a tank to prevent spill-over is included.

Descriptors: *Legislation, *Surface waters, *Separation techniques.
Identifiers: *Germany, Storm sewage, *Oil separators.

In connection with the legislation for the protection of Berlin surface waters, which prohibits the discharge of oil emulsions, the author discusses the use of oil separators for areas where large volumes of oil are handled and where spillage is washed off into the receiving water by rainfall. These oil separators can be installed in sections along areas likely to be affected before storm sewage enters the receiving waters. Standards for the design of such separators are discussed.

STORM WATER TREATMENT AT CLEVELAND,
George D. Simpson, and Lamont W. Curtis.
J. Water Pollution Control Fed, Vol 41, No 2, Part 1, p 151-168, Feb 1969. Paper from Am Water Works Assoc - 88th Annual Conference, Cleveland, Ohio June 2-7, 1968.

Descriptors: *Watersheds (Basins), *Multiple-purpose projects, *Pressure conduits, *Pumping plants, *Water pollution control, *Chlorination, *Pollution abatement, *Lake Erie, Biological treatment, Reduction (Chemical), Recreation facilities.
Identifiers: *Gravity sewer, *Cleveland, Ohio.

A feasibility study was conducted for the FWPCA of a proposed offshore stabilization-retention basin, for the treatment of various polluting flows now being discharged to Lake Erie. The basin would receive treated effluent flow from the City's Easterly Waste water Treatment Plant, as well as flow from six large combined sewer overflow outfalls, and flow from five polluted streams which drain the service area. The proposed basin would be approximately 900 acres in area, with a mean water depth of 33.5 ft. A shoreline collection system is included to convey flows to two central points for discharge into the basin. The collection system will consist of a combination of gravity and pressure conduits, with two pumping stations. Two basic types of purification processes will take place in the basin. Biological and chemical oxidation will result in reduction of BOD and COD; this process will require an aerobic environment. Sedimentation of fine suspended solids, particularly the activated sludge cell matter in the treatment plant effluent, will require quiescent settling. To meet these two conditions, a two stage basin is contem plated. The first stage will be maintained in aerobi condition by air-lift or mechanical pumping. In th quiescent sedimentation stage, it is expected tha an upper layer of five to ten feet of water will b aerobic, with the remainder of the depth anaerobi The basin will create a sheltered bay at th shoreline, which will be used for boating, fishin and swimming. A small boat marina is contem plated as part of the overall project. The basin wi be provided with facilities for chlorination. Effluen will be discharged at about 8,000 ft. from shore in water depth of approximately 42 ft. The basin ha been found feasible from the standpoint of pollu tion abatement and reduction of bacterial con tamination of the City's beaches resulting from pol luted discharges.

OPTIMIZING WASTE TREATMENT CONTRO SYSTEMS,
Ernest T. Williams, Jr.
Paper presented at the Third Annual National Pol lution Control Conference and Exposition, April 1 3, 1970, San Francisco, California.

Descriptors: *Instrumentation, *Waste treatment *Control systems, *Measurement.

As waste treatment and recovery processes becom more complex and costly, there is increasing reliance upon instrumentation to assume contro responsibility for the most economic and efficien operation. This paper describes the control system normally used on four applications, and discusses what can be done to optimize performance. The use of dissolved oxygen and sludge density mea surement in the activated sludge process is ex plored. The second application is pH neutraliza tion. Feedforward control and the nonlinear con troller have dramatically improved neutralization performance. Improvements are also suggested in the control schemes of chromate waste and cyanide waste treatment processes.

CLEANING OUR ENVIRONMENT-THE CHEMICAL BASIS FOR ACTION: SECTION 2 - THE WATER ENVIRONMENT: MUNICIPAL WASTE WATER TREATMENT.
Subcommittee on Environmental Improvement, Committee on Chemistry and Public Affairs American Chemical Society, p 106-122, 1969. 2 fig, 4 tab.

Descriptors: *Waste water treatment, *Overflow, *Storm runoff, *Flocculation, *Treatment facilities, *Water reuse, Sewage treatment, Storage tanks, Underground storage.
Identifiers: *Combined sewers, *Stormwater quality.

This subsection discusses existing processes, recent advances, and current problems relating to municipal waste water treatment. Urban stormwater problems from combined sewer overflows are explained, and possible solutions presented, such as storing overflow and then passing it to plants for skimming and sedimentation and/or polymeric flocculation treatment. Other means of handling overflows include storage in fully or partially flexible underwater tanks or in underground tunnels with subsequent treatment, chlorination, and filtration aided by ultrasonic energy. One current project is evaluating the use of 1-2-acre ponds to collect stormwater runoff and then treat it for reuse. The following recommendations in the area of municipal waste water treatment were made: (1) more research by biochemists and biologists on sewage treatment, primarily to seek radical innovations based on fundamentals of microbiological processes; (2) research expansion on new methods of handling waste water treatment sludges and on parameters involved in using synthetic polymers and polyelectrolytes to improve flocculation, sedimentation, and conditioning of such sludges; and (3) more systematic studies on urban stormwater

uality to provide a sounder base for evaluating arious means of treatment.

entifiers: Oxidation ditches, Pasveer oxidation tch, Slotted floor, Livestock buildings, Ciliated otozoan, Swine, Oxygenation capacity, Loading tes, Field tests.

vine wastes research for the three-year period ginning September 1, 1966 is summarized. Upon nding that swine manure could be aerobically eated, a modification of the Pasveer oxidation tch was tested. The in-the-building oxidation tch has proven itself in the field as capable not ly of eliminating objectionable odors from anure pits but of reducing the BOD5 pollutional lue of the waste by about 90 percent. The volatile lids can also be reduced by about 50 percent. ven so, the mixed liquor should not be discharged rectly into a stream. There will, however, be sur-us water and sludge to be disposed of, as with any her waste-treatment system. Operating the ditch th a constant liquid depth and a constant rotor mersion depth is recommended for operator nvenience. This can be done by using an over-w. Having the mixed liquor overflow into an robic lagoon is also in keeping with operator conience and low labor requirements. The lagoon n have a fluctuating depth, so that surplus water d sludge can be removed at a convenient time. he simplest method is by using irrigating equipent. (Christenbury-Iowa State)

FFECTS OF SURFACE RUNOFF ON THE EASIBILITY OF MUNICIPAL ADVANCED ASTE TREATMENT,
wa State Univ., Ames. Dept. of Civil Engineering.
obert E. Baumann, and Sheldon Kelman.
gricultural Practices and Water Quality, Iowa ate University Press, Ames, Iowa, 1970, Chapter , p 344-362. 7 fig, 1 tab, 19 ref.

escriptors: *Surface runoff, *Sewage treatment, rtiary treatment, Biochemical oxygen demand, dustrial wastes, Farm wastes, Pollutants, Fertilrs, Nitrogen, Nitrates, Phosphorus, Phosphates, gae, Eutrophication, Water quality, Rivers, Iowa, rn, Discharge, Chlorophyll.
entifiers: Industrial water pollution, Des Moines ver, Packing plants.

e protection of the quality of water in Iowa eams requires that attention be directed at the rious contributors of the significant pollutants. tention is currently being directed at municipal d industrial wastes discharges, since these enter eams through a point source and are easily conlled. All such wastes must be given secondary atment prior to discharge to Iowa's streams. As re stringent treatment requirements are deended in the future, there is some question as to ether nutrient removals from municipal and instrial wastes will be sufficient to protect the eam. This study indicated that during periods of dry weather when light and turbidity conditions are favorable for phytoplankton growth, the principal source of the N and P required to support such growth is derived from municipal and industrial waste water discharges. Removal of N and P from such waste water discharges will help reduce phytoplankton growth. In periods of high stream flow, when turbidity levels are high enough to be unfavorable to phytoplankton growth, runoff from urban and rural lands and channel erosion are probably the principal contributors of N and P to the stream. Removal of N and P from municipal and industrial wastes during these periods will not reduce nutrient levels significantly. Under the latter conditions, tertiary treatment of municipal and industrial wastes will be of less benefit until runoff contributions of N and P are also controlled. LIQUID HANDLING OF POULTRY MANURE,
Massachusetts Univ., Amherst. Dept. of Agricultural Engineering.
Curtis A. Johnson.
ASAE Paper No NA 64-501. Transactions of the American Society of Agricultural Engineers, Vol 8, p 124-126, 1965. 2 fig, 1 tab, 6 ref.

Descriptors: *Liquid waste, *Order, *Septic tanks, *Water reuse, Farm waste, Sludge disposal, Poultry, Ammonia, Disposal, Design criteria, Cost comparisons, Effluents, Waste water treatment.
Identifiers: *Recycling, Liquid-manure handling, Ammonia odor, Congdon system.

This article describes an integrated system concept for liquid manure handling of waste produced by laying hens in conventional commercial cage units. The bird droppings in this unit collect in 8 inch deep, 44 inch wide troughs formed on original floor with 4 inch thick concrete blocks. The lower end of each sloped trough is closed with a 2 inch x 6 inch board. These boards are removed to empty the troughs into a 24 inch by 24 inch trench running across the end of the building below floor level. This sloping trench empites into a 12 inch diameter plastic pipe which conveys the waste to an underground septic tank. From the third compartment of this three-compartment tank the effluent is pumped back into the laying house to hydraulically clean the troughs beneath the cages. The effluent becomes increasingly concentrated. The effluent is periodically pumped onto forest land and the sludge is 'batch' handled. This manure system provides: (1) Easy manure handling, (2) Few moving parts, (3) Little ammonia odor, (4) Low water usage, (5) Simple manure disposal, (6) Low-cost pit cleaning. (Parker-Iowa State)

AGRICULTURE WASTE RESEARCH NEEDS,
Cloisterdale Farms, Ephrata, Pa.
Glenn H. Herr.
Compost Science, Journal of Waste Recycling, Vol 11, No 5, Sept-Oct 1970, p 8-11. 4 fig.

Descriptors: *Farm waste, *Poultry, *Disposal, *Drying, Odor, Costs, Equipment, Aeration, Lagoons, Irrigation, Waste water treatment.
Identifiers: SHUD, Neighbors.

The author is responsible for disposal of 17,000 plus or minus tons of raw waste annually from a laying hen complex of 360,000 hens. Their problems incidental to poultry 'SHUD' were: first - volume accumulation of shud within houses, second - community relations - odor primarily; danger of soil and water pollution secondarily. Third - ultimate disposal, and, finally fourth - the unknown factor of the possibility of, or the effect of, gas toxicity to the chickens and humans. Some of their attempted and/or considered methods for disposal were the use of: (1) lagoons; (2) irrigation; (3) sewage treatment plant; (4) incineration; (5) burying; (6) hauling and spreading; future consideration: (7) semidrying; (8) possible dehydration - which might lead to: fertilizer products; re-feeding; or some other uses. Their conclusion was that liquid handling would not be the long range answer to their problems. They concluded that some method of dry or semi-dry procedure must develop as their solution and as an industry solution. Mr. Herr describes the system of drying the manure in place and the cost of disposal of the simi-dried (30%) SHUD. (Christenbury-Iowa State)

ANAEROBIC DECOMPOSITION OF SWINE EXCREMENT,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
O. E. Cross, and Alvaro Duran.
Nebraska Agricultural Experiment Station Journal Paper No 2531. Transactions of the ASAE, Vol 13, No 3, May 1970, p 320-322. 11 fig, 7 ref.

Descriptors: *Farm wastes, Laboratory tests, *Anaerobic digestion, *Hogs, Anaerobic conditions, Temperature, Sludge, Biochemical oxygen demand, Hydrogen ion concentration, Waste water treatment.
Identifiers: Swine, Loading rates, Volatile solids, Detention times, Digesters.

This paper presents a laboratory analysis on the anaerobic digestion of swine excrement as affected by temperature and loading rate. The tests were run for 15 days. The experiments were conducted using ambient temperatures of 50, 70, and 90 F. at three loading rates. The loading rates were 3.2, 1.6, and 0.8 g. of volatile solids per liter of digester volume per day. Volatile-solids content was determined daily during a 15-day test period. Moisture content, total solids, fixed solids and pH were also determined daily. A 5-day BOD test was performed. None of the experiments reached equilibrium; however, it was possible to detect a tendency of the system to approach equilibrium or to approach failure. The results showed that for a load of 0.8 g. at all temperatures the system indicated success in the digestibility of the organic matter. At a load of 3.2 g. at 70 F and 50 F the system tended toward failure. (Christenbury-Iowa State)

USE ANIMAL MANURE EFFECTIVELY,
Arizona Agricultural Experiment Station, Tucson.
J. L. Abbott.
Agricultural Experiment Station and Cooperative Extension Service Bulletin A-55, The University of Arizona. 3 tab, 1 fig, 6 ref.

Descriptors: *Farm wastes, *Fertilizers, *Rates of application, *Return (Monetary), *Beneficial use, Livestock, Arizona, Feedlots, Disposal, Costs, Salts, Nitrogen, Organic matter, Waste treatment.
Identifiers: Manure, Composting.

This publication discusses some important considerations that should be taken into account concerning the use of animal manure as a fertilizer. A possible $90-per-acre return for a $20-per-acre investment is being overlooked by many Arizona farmers. The cost of applying manure is in the order of $2 to $14 per ton up to a 40 mile haul. The fertilizer value of manure is at least $2 per tone for available N and P. The value of organic matter must account for the balance in cost. The greatest value of manure may result from the indirect effects of the organic matter contribution on the physical condition of the soil and in maintaining the availability of certain soil nutrients. The soluble salts in manure commonly range from 5 to 10 percent on a dry basis. Recommendations for manure are seldom more than 5 tons per acre annually. (Christenbury-Iowa State)

5E. Ultimate Disposal of Wastes

THE PRESENT STATE AND PROSPECTS OF DEVELOPMENT IN RADIOACTIVE WASTE MANAGEMENT IN THE USSR,
Gosudarstvennyi Komitet po Ispolzovaniyu Atomnoi Energii SSSR, Moscow.
B. S. Kolychev, and V. M. Sedow.
Atomic Energy Review, Vol 5, No 4, p 123-150, 1967. 16 fig, 7 tab, 28 ref.

Descriptors: *Radioactive waste disposal, *Ultimate disposal, *Technology, Nuclear wastes, Costs, Waste storage, Waste disposal, Waste water treatment, Pilot plants, Safety, Nuclear reactors, Radioactive wastes, Waste treatment, Nuclear wastes, Drying.
Identifiers: *USSR, Decontamination, Solidification, Burial, Cementation, Bituminization.

This report summarized different chemical methods of liquid radioactive waste decontamination. Combined liquid and solid waste burial following cementation was put in practice. Waste disposal into deep geological formations is fairly safe and the cost does not exceed 1 ruble per cu meter. Studies are under way on solidification of wastes by drying and bituminization, and on the development of reactor cleaning process using electrophoresis and pre-coated filters. Attention has also been paid to new designs of evaporators, driers, electrodialyzers, centrifuges, filters, and equipment for treatment and burial of radioactive wastes. (Wilde-Wisconsin)

A FEASIBILITY ANALYSIS OF INCINERATOR SYSTEMS FOR RESTORATION OF OIL CONTAMINATED BEACHES,
Envirogenics Co., El Monte, Calif. Division of Aerojet General Corporation.
R. M. Roberts, and J. S. Hoyt.
Copy available from GPO Sup Doc as I 67, 13/4, 15080 DXE 11/70, $0.75, microfiche from NTIS as PB-198 227, $0.95. EPA-WQO Report 15080 DXE, November 1970. 73 p, 16 fig, 10 tab, 37 ref. EPA-WQO Contract 14-12-595.

Descriptors: *Beaches, *Oil wastes, *Cleaning, Shore Protection, Shores, Coasts, Incineration, Oily water, Disposal, Wastes, Burning.
Identifiers: *Oil spills, *Beach decontamination.

The feasibility of employing a combustion effect for restoring oil contaminated beaches was investigated. Beach access problems and the handling characteristics of shore materials limited the potential application to recreational (sand) sites. Thermodynamic arguments required that a system design be adopted in which the contaminated sand would undergo combustive processing in a confined arrangement. The design selected, from those analyzed, proved to be a three-effect combustor based on the rotary kiln principle. Provided that the sand to be cleaned is carefully enough collected to furnish a reasonable (greater than or equal to 6%) oil content and is moved away from the surf and drained to an acceptable moisture level (less than or equal to 6%) processing costs would be highly attractive. In comparison with uncontaminated sand, the cleaned product exhibits only a slightly greyish hue.

THE WRAY FLOOD DISASTER AND ITS E FECTS ON THE PUBLIC HEALTH SERVICES
D. H. Maud.
Inst Public Health Engrs. Vol 67, Part 4, p 244-2 Oct 1968.

Descriptors: *Storm runoff, *Outlets, *Bypass Sewage treatment, Repairing, Sewage.

Intense thunderstorms and flooding damaged t water supply system and sewerage and sewa disposal systems of the town of Wray on the ri Roeburn. As a result of the storm, the outlet pi which allowed storm water overflow to pass to t river, was completely filled with silt as were oth parts of the sewage disposal system. In addition repairs on the sewer disposal and sewerage syste town workers cleared the outfall pipe, th establishing a bypass to the river. They then co nected the washout valve on the filter feedline ne the dosing chamber to the humus tanks. By r opening the inlet valve to the primary sediment tion tank and opening the dosing chambe washout, primary tank effluent was routed to t humus tanks; and thus, a two-stage settleme treatment system was instituted in place discharging raw sewage over the side weir stor overflow.

REMOVAL OF CONTAMINANTS FROM LAK ONTARIO BY NATURAL PROCESSES,
Canadian Oceanographic Data Centre, Ottaw (Ontario).
H. E. Sweers.
In: Proceedings Twelfth Conference on Gre Lakes Research, May 5-7, 1969, University Michigan, Ann Arbor: International Associatio for Great Lakes Research, p 734-741, 1969. 8 p, fig, 7 ref.

Descriptors: *Self-purification, *Water pollutio control, *Lake Ontario, *Water circulation, Pat of pollutants, Nutrients, Algae, Stratified flow Mixing, Flow, Model studies, Mathematica models, Great Lakes, Thermal stratification.
Identifiers: Removal time (Pollutants).

A model is developed to calculate the removal tim of a conservative contaminant from a lake, takin summer stratification into account. The basic as

sumptions of the model were compared with conditions actually occurring in Lake Ontario, and it is shown that stratification has little effect on the calculated removal time. The results are extrapolated to the behavior of non-conservative parameters. A sharp reduction in the rate of input of nutrients could result in a marked decrease in algal growth within a year after such measures become effective. (See also W71-05561) (Knapp-USGS)

PESTICIDE RESIDUES AND ENVIRONMENTAL ECONOMICS,
Florida Univ., Gainesville; and Missouri Univ., Columbia.
W. F. Edwards, Max R. Langham, and J. C. Headley.
Natural Resources Journal, Vol 10, No 4, p 719-731, October 1970.

Descriptors: *Pesticide residues, Cost-benefit analysis, Social welfare, Regression analysis, Marginal cost, Marginal value, Productivity.
Identifiers: *Environmental economics, Externalities, Objective function, Property rights, Consumer surplus, Producer surplus.

The relationship between externalities and public policy in environmental quality management are considered. Disputes created by externalities can be settled through participatory decision-making but policy decisions reached in this way do not represent social costs and benefits precisely. If social costs and benefits are the major determinants of public policy then better measures of social welfare are necessary. The author presents two studies which provide empirical measures for pesticide policy-making. The first study measures the productivity of pesticides for U.S. agriculture as a whole. The second study tries to include externalities in a policy decision model to determine which of two pesticide policies is optimal from a social welfare point of view. The measure of social welfare used in this study consisted of consumers' surplus plus producers' surplus modified for externalities. This model is capable of including reduction in both air and water quality and is relevant to water studies concerned with the role of non-market effects in water quality management. Ohio State Univ., Columbus. Dept. of Microbial and Cellular Biology.
Walter O. Leshniowsky, Patrick R. Dugan, Robert M. Pfister, James I. Frea, and Chester I. Randles.
American Association for the Advancement of Science, Vol 169, p 993-995, 1970. 1 fig, 22 ref.

Descriptors: *Aldrin, *Chlorinated hydrocarbon pesticide, *Flocculation, *Bacteria, Lake Erie, Adsorption, Colloids, Sediments, Diatoms, Detritus, Suspended load, Insecticides, Silts, Pesticides, Lakes.
Identifiers: *Floc forming bacteria, Inorganic particles, Microparticulates, Flavobacterium, Protaminobacter, Bacillus.

Studies of chlorinated hydrocarbon insecticides in a water column indicated that floc-forming bacteria isolated from Lake Erie adsorb and concentrate aldrin from colloidal dispersion and the subsequent settling of the bacterial flocs remove aldrin from the water phase. One bacterium was an orange-red pigmented gram-negative rod, tentatively identified as either a Flavobacterium or Protaminobacter. The other was a gram-positive species of Bacillus. Gram-negative bacteria adsorption is slower as compared to the gram-positive, with considerable concentrating effect. Contemporary sediments forming in Lake Erie contain aldrin and could adsorb more. The presence of both aldrin and dieldrin was detected by both gas chromatography and microcoulometry. Electron microscopic examination of Lake Erie contemporary sediments show that these sediments consist of a conglomerate floc of bacteria, diatoms, and inorganic and detrital particles. Flocculent bacteria also adsorb microparticulates, and this adsorption capacity represents a mechanism for sediment formation, and for the removal of suspended particles including aldrin from the water column. WATER POLLUTION: OBSERVATIONS ON CONNECTICUT'S RESPONSE,
Edward W. Manasse, and Edward Kiel.
Connecticut Law Review, Vol 3, No 1, p 206-224, 1970. 19 p, 82 ref.

Descriptors: *Connecticut, *Pollution abatement, *Water quality control, *Legislation, Water pollution control, Massachusetts, Colorado, Pennsylvania, Water conservation, Water resources, Impaired water quality, Financing, Cost sharing, Damages, Remedies, Industrial wastes, Municipal wastes, Public health, State governments, Local governments, Administrative agencies, Judicial decisions, Legal aspects.

In order to assess the Connecticut Clean Waters Act of 1967, this article compares it with the traditional common law response to the pollution problem, the Massachusetts approach, and the legislative answers preferred by Colorado and Pennsylvania. It is concluded that these other approaches to the problem are inadequate in that they are compatible with continued pollution of water, lack sufficient sanctioning power, and lack provision for funding of pollution abatement. The Clean Waters Act is a model for the achievement of successful pollution abatement. The future of water resources in Connecticut has been given a large thrust forward, due in large part to: the newly created enforcement methods, the threat of potentially severe economic penalties, and the ability to order corrective action to abate what may appear to be a possible future source of pollution. An evaluation of the effect and future potential of the Act at the actual operating level is made. The Water Resources Commission has been active in its supervision of water pollution abatement. If its present level of activity is maintained, Connecticut may conceivably have clean waters by its target date of 1974. (Smiljanich-Florida)
W71-06047

THE ENVIRONMENTAL LAWSUIT: TRADITIONAL DOCTRINES AND EVOLVING THEORIES TO CONTROL POLLUTION,
Robert R. Lohrmann.
Wayne Law Review, Vol 16, No 3, p 1085-1135, 1970. 51 p, 270 ref.

Descriptors: *Water pollution control, *Pollution abatement, *Legal aspects, *Remedies, Judicial decisions, Legislation, Environment, Ecology, Legal aspects, Administration, Federal government, State governments, Governments, Regulation, Environmental effects, Environmental sanitation, Balance of nature, Natural resources, Federal jurisdiction, State jurisdication, Political aspects, Adjudication procedure.
Identifiers: Constitutional aspects.

Dealing with environmental lawsuits in general, this article first examines the procedural considerations involved, including: standing to sue in the federal and state courts, class actions, and burden of proof. Next, tort remedies are considered and compared to determine their ultimate values in environmental litigation. These include: nuisance, both public and private; trespass; strict liability; and negligence. The public trust doctrine is examined to determine its possible use in environmental lawsuits. Statutory rights created by both federal and state legislation are interpreted and evaluated. Constitutional rights to a healthful environment are examined in light of certain recent state constitutional provisions, as well as those already existing as penumbral rights under the United States Constitution. The author contends that environmental lawsuits play two significant roles: (1) the development of a body of case law which will indicate to legislators the areas of concern and the legal issues, and (2) the regulation of localized pollution. (Robinson-Florida)

CONTROL OF RELEASES OF RADIOACTIVITY TO THE ENVIRONMENT.
Atomic Energy Commission, Washington, D.C.

Federal Register, Vol 35, No 63, Wednesday, April 1, 1970, p 5414-5416.

Descriptors: *Radioactive wastes, *Nuclear reactors, *Nuclear powerplants, *Administrative agencies, Federal government, Industrial wastes, Radiation, Public health, Environmental effects, Hazards, Water pollution sources, Nuclear energy,

Electric power industry, Electric power production, Nuclear wastes, Waste treatment, Waste water treatment, Treatment facilities, Effluents, Waste water (Pollution), Institutional constraints, Regulation, Adoption of practices, Permits.
Identifiers: *Administrative regulations.

In these proposed amendments to existing regulations, the Atomic Energy Commission would require licensees to maintain radiation levels below specified standards. Persons engaged in licensed activities would be required to make every reasonable effort to keep radiation exposure and effluent release in unrestricted areas as far below specified limits as practicable. Applicants for licenses must identify the design objectives and the means to be employed to keep radioactive effluent material as low as possible. Light-water-cooled power reactor licenses will include specifications requiring adherence to effluent-control procedures and the maintenance and use of waste treatment equipment. Semiannual reports detailing the quantity of radioactive material released would be filed and after compilation released to the public. In proposing these amendments the Commission notes that: (1) AEC standards are based on Federal Radiation Council guidelines; (2) an increase in the size and number of reactors may be expected; (3) there is a recognized need for flexibility in the operation of nuclear plants; (4) monitoring activities continue to be important; and (5) research and development by the nuclear power industry will continue to be encouraged. (Earl-Florida)

VIEWS OF THE GOVERNORS ON TAX INCENTIVES AND EFFLUENT CHARGES (WATER POLLUTION CONTROL AND ABATEMENT).

House Comm on Government Operations, H Rep No 1330, 89th Cong, 2d Sess 1966. 75 p.

Descriptors: *Pollution abatement, *Industries, *Federal government, *State governments, Water pollution, Water pollution control, Public health, Water quality, Taxes, Effluents, Sewage effluents, Legal aspects.
Identifiers: *Tax incentives, *Effluent charges.

The House Committee on Government Operations conducted a study to determine methods for preventing and controlling water pollution. The views of the nation's state governors were solicited to determine the efficacy of tax incentives and effluent charges to achieve pollution abatement. The report reaches several conclusions. Tax incentives to encourage pollution abatement are not extensively used by the states although legislation in the area is being considered. Prior experience indicates that industry frequently fails to utilize tax incentive programs for pollution abatement. Most states support federal tax incentive programs for pollution abatement, and no conflict between such a federal program and similar state programs was observed. However, those opposing tax incentives suggested that industry should not be paid for complying with pollution law. No state currently utilizes effluent charges to control pollution. Most governors opposed federal effluent charges as a license to pollute and because of anticipated difficulty in administration. (Hart-Florida)

WATER POLLUTION PROBLEMS AND CONTROL PROGRAMS IN MICHIGAN'S PORTION OF THE GREAT LAKES.
Michigan Water Resources Commission, Lansing.

Excerpted from Clean Water It's up to you. Typescript, 10 p

Descriptors: *Michigan, *Great Lakes, *Water pollution control, *Water pollution sources, Water quality control, Water resources development, Pollution abatement, Lake Erie, Lake Huron, Lake Michigan, Lake Superior, Waste treatment, Administrative agencies, State governments, Federal government, Thermal pollution, Storm runoff, Oil, Ships, Irrigation effects, Runoff, Acid mine water, Sediments, Estuarine environment, Eutrophication.

A survey of water quality conditions of the Great Lakes surrounding Michigan shows that the lakes are of high quality and relatively unpolluted, with the exception of Lake Erie and portions of Lake Michigan. The Michigan Water Resources Commission is effective in anti-pollution efforts, especially through voluntary pollution abatement. The Commission specifies restrictions on waste discharges, and a deadline is established for meeting these limitations. Where voluntary compliance is ineffective, the Commission does not hesitate in seeking court action or pursuing the penalty provisions of the law. A survey is made of various enforcement conferences called by the Secretary of the Interior. The top priority pollution problems requiring development of improved control techniques include: (1) thermal pollution from power plants and industry; (2) storm water overflows which bypass sewage treatment plants; (3) oil spills; (4) vessel pollution in harbors and heavily used waterways; (5) irrigation pollution resulting in concentrated salts and minerals; (6) agricultural runoff; (7) acid mine drainage; (8) increase in sediment volumes; (9) destruction of estuaries by pollution, dredging, and filling; and (10) eutrophication by addition of excessive nutrients. A brief survey of waste treatment methods is included. (Smiljanich-Florida)

WATER QUALITY STANDARDS.
Department of the Interior, Washington, D.C.

Code of Federal Regulations, Title 18, Chap V, part 620, 1970. 10 p.

Descriptors: *Water quality control, *Standards, *State governments, *Pollution abatement, Water Quality Act, Water pollution control, Federal government, Administrative agencies, Regulation, Administration, Water policy, Adoption of practices, Legal aspects, Legislation, Public health, District of Columbia, United States, Water resources development, Governments, Federal jurisdiction.
Identifiers: *Federal Water Pollution Control Act.

Pursuant to the Federal Water Pollution Control Act, the Secretary of the Interior herein identifies and describes those state-adopted water quality standards which meet the criteria of the federal act. The water quality standards consist of state water quality criteria and a plan for the enforcement and implementation of such criteria. The Secretary must determine if such standards will protect the public health or welfare, enhance the quality of water and serve the purposes of the federal act. The standards thus qualifying are available for inspection at offices of the Federal Water Pollution Control Administration. Each state, plus the District of Columbia and territories of the United States, is listed with reference to its approved water quality standards. (Smiljanich-Florida)

THE ENFORCEMENT PHASE OF POLLUTION ABATEMENT: THE ROLE OF THE ARMY ENGINEERS,
Gunnar K. Mykland.
Water and Sewage Works, Vol 117, No 6, p 213-216, June 1970.

Descriptors: *Pollution abatement, *Water pollution, *Administrative agencies, *Water pollution control, Legislation, Legal aspects, Judicial decisions, Rivers and Harbors Act, Water Quality Act, Federal government, Administrative decisions, Governments, Administration, Regulation, Abatement, Non-structural alternatives.

The Army Corps of Engineers has primary responsibility for enforcement of federal anti-pollution legislation. During 1969, the Corps of Engineers reported an average of one violation per day to the Department of Justice for prosecution. The various examples of older legislation utilized to abate pollution are discussed in this article, including the Rivers and Harbors Act and the Oil Pollution Act of 1924. It is observed that the primary object of the earlier legislation was to protect navigation from obstruction and injury, and hence enforcement was focused on this purpose. Conversely, the article observes that present enforcement emphasizes protection of the general public interest rather than protection of navigation. Two problems of enforcement are: (1) difficulty in securing sufficient evidence to justify prosecution; and (2) insufficient personnel to police the numerous and widely dispersed areas. Pollution abatement is said to depend upon increased public concern and familiarization with available legislation. Recent legislation examined includes: (1) the Oil Pollution Act of 1961; (2) the Fish and Wildlife Coordination Act; (3) the National Environmental Policy Act; and (4) the Water Quality Improvement Act. A number of landmark court decisions are also noted. (Hart-Florida)

SIMULATION OF A WATER RESOURCE SYSTEM, FINAL REPORT,
Washington Univ., Seattle. Fisheries Research Inst.
William H. Lenarz.
University of Washington Fisheries Research Institute, February 5, 1969. 10 p, 1 fig, 11 refs. OWRR Project A-003-Wash (1).

Descriptors: *Model studies, *Computer models, *Abstracts, *Computer programs, Sampling, Data collection, Data processing, River forecasting, Anadromous fish, Salmon, River flow, Zooplankton, Fish management, Fish harvest, Washington.
Identifiers: Green-Duwamish Rivers of Washington, Duwamish Estuary of Washington, Elliott Bay of Washington.

Computer analysis and modeling using field data from automatic water-quality monitors was tested and found to provide sufficient information for evaluation of general trends affecting fish populations, such as dissolved oxygen, temperature, and pH. Other projects were undertaken for which data was collected and analyzed and computer programs written. A series of models, simulating population dynamics in freshwater zooplankton, analysis of problems of determining maximum sustained yield of a mixture of fish stocks, a simulation of anadromous fish migration, and a simulated river flow model for which a flow diagram is given, were developed. The Green-Duwamish Rivers and the Duwamish Estuary-Elliott Bay area were used in the model studies. A list of publications resulting from this research is appended to the report. (Yensen - Arizona)

WATER QUALITY TELEMETRY FINAL PROGRESS REPORT,
Utah Water Research Lab., Logan.
Durad S. Woffinden, and Allen D. Kartchner.
Utah Water Research Laboratory Report PRWG 3-2 College of Engineering, Utah State University, August 1969. 42 p, 29 fig, 2 tab. FWPCA Grant No WPD 179-02-68.

Descriptors: *Water quality control, *Telemetry, *Remote sensing, *Design, *Engineering, Water measurement, Data collections, Data transmission, Sampling, Instrumentation, Electronic equipment, Construction costs, Cost analysis, Analytical techniques, Methodology, Water properties.

A battery-powered radio-telemetry method for monitoring water quality has been developed by the Utah Water Research Laboratory. Overcoming the major difficulty of large, unwieldy size, the Utah Water Research Laboratory's unit is small enough to be hand-carried, being housed in a 15 in. x 15 in. x 14 in. fiberglass case. Photographs illustrate the unit. A technical description is given, in-

cluding circuitry, block diagrams of the field station and base station, transmitter receiver control and power interconnections, timer operation, and station reply techniques. Measurements of dissolved oxygen, temperature, pH, and conductivity can be made automatically, and the circuits for each of these measuring devices are outlined. A table analyzes costs of both field and base stations, including assembly time and labor costs. (Yensen - Arizona)

ONE-DIMENSIONAL OPEN CHANNEL HEAT DISPERSION,
Tennessee Univ., Knoxville.
David Chung-Shung Chou.
MS Thesis, University of Tennessee, June 1969. 53 p, 35 ref, 6 tab, 7 fig.

Descriptors: *Dispersion, *Heat transfer, *Temperature, *Mathematical models, Hydraulic models, Energy transfer, Convection, Diffusion, Mixing, Water pollution, Channel flow, Open channel flow, Hydraulics.
Identifiers: Heat dispersion modeling, Heat dispersion coefficients.

A one-dimensional mathematical model which describes the turbulent mixing process under steady uniform flow conditions has been developed for predicting the longitudinal heat dispersion coefficient in a laboratory flume. Heated water was used as the tracer in these experiments. It was found that a solution to the general dispersion equation is applicable to describe the turbulent mixing process involved with heat dispersion for a one-dimensional open channel flow. A set of heat dispersion coefficients in the laboratory flume was obtained under five different uniform steady flow conditions. The experimental results showed that the longitudinal heat dispersion coefficient, DL, increases the depth of flow decrease. (Novotny-Vanderbilt)

COOLING WATER RESOURCES AND POWER GENERATION,
Southern California Edison Co., Los Angeles.
J. R. Laverty, and P. J. West.
Presented at National Water Resource Conference, ASCE, Phoenix, Arizona, January 1971. Typescript, 21 p.

Descriptors: *Cooling water, *Thermal powerplants, Thermal pollution, Temperature, California, Thermal power, Electric power, Electric power industry, Cooling, Water resources, Colorado River, Water supply.

Sources of cooling water are the ocean, reclaimed waste water, and fresh water. The problems connected with the use of water from these sources are discussed, based on trends in power generation needs in the future. Different cooling systems in steam power plants are described (once-through cooling, evaporative cooling towers, ponds, etc.). In southern California, a particular attention has to be paid to the fresh water cooling resources, and problems connected with it are discussed in the paper. It has been predicted by Edison Company that the cooling water demand by the company will be 70 times greater in the year 2010 than in 1970. It has been found that the water will have to be imported from other regions in order to satisfy such great amounts of cooling water. Also, the future powerplants will have to be located outside of southern California. The sea water is also considered as a main future cooling water resource. (Novotny-Vanderbilt)

STUDY OF EQUIPMENT AND METHODS FOR REMOVING OR DISPERSING OIL FROM OPEN WATERS,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
C. H. Henager, P. C. Walkup, J. R. Blacklaw, J. D. Smith, and L. M. Polentz.
Available from NTIS as AD-716 792, $3.00 in paper copy, $0.95 in microfiche. Report No CR71-001, August 1970. 239 p, 47 fig, 15 tab, 50 ref. Navy Contract N62399-70-C-0008.
Identifiers: *Water pollution, *Oils, Costs, Petroleum, Removal, Combustion, Toxicity, Oceans, Lakes, *Oil pollution, *Water pollution control, *Water pollution control equipment, Skimmers, Booms equipment, *Dispersants, *Emulsification.

A cost effectiveness analysis was performed for equipment, materials and techniques applicable to the removal or dispersal of spilled oil from U.S. Navy AO and AOG vessels on open waters. Effectiveness parameters included oil product types (JP-5, Distillate Fuel, Navy Special and Bunker C), expected spill locations (3 and 12 miles from shore) and size of expected spill (10 tons, 1000 tons and 25,000 tons). Criteria for evaluation of systems under the above parameter situations, formulated for presently available equipment and materials, include: completeness of oil removal; rate of removal; hazard and pollution; use in limited access areas; sensitivity to expected environmental factors; sensitivity to temperature extremes; toxicity to marine life and system avilability. Cost effectiveness was determined using the 3 spill sizes and checked for spill frequency. The three most cost effective systems for the spectrum of spill sizes were found to be burning of the oil, dispersing the spilled oil and mechanical skimming. Considering system applicability to various products and the practical requirements of rate of removal for massive spills, the most practical universal system with a favorable cost effectiveness ratio was found to be dispersing. This is followed by dispersing plus a containment boom. Burning agents applied directly to the spill was judged to the third system based on its favorable cost effectiveness but limited applicability to oil types and permissible burning circumstances.

WATER QUALITY MANAGEMENT PROBLEMS IN ARID REGIONS.
Robert S. Kerr Water Research Center, Ada, Okla. Treatment and Control Research Program.

Available from NTIS as PB-198 125, $3.00 in paper copy, $0.95 in microfiche. James P. Law, Jr., and Jack L. Witherow, Editors. Federal Water Quality Administration Water Pollution Control Research Series 13030 DYY 6/69, October 1970. 105 p. FWQA Program 13030 DYY.

Descriptors: *Conferences, *Water quality, *Water pollution sources, *Water pollution control, *Arid lands, Irrigation, Agriculture, Evaporation, Salinity, Farm wastes, Surface waters, Groundwater, Planning, Irrigation effects, Wastes, Nutrients.

An international conference entitled 'Arid Lands in a Changing World' sponsored by the American Association for the Advancement of Science Committee on Arid Lands and the University of Arizona, was held at Tucson in June, 1969. The Federal Water Quality Administration provided financial support for the conference and solicited papers to be presented in the Water Management and Salinity and Desalinization sessions. This report presents a selected group of the papers presented at those sessions which should benefit those concerned with water quality management problems in arid regions. The title of the papers included in this report are as follows: nitrate removal from agricultural waste water; the effects of salinity standards on irrigated agriculture in the Colorado River basin; problems of pollution of irrigation waters in arid regions; water quality requirements and re-use of waste water effluents; salinity control in return flow from irrigated areas--a demonstration project; water quality control problems in inland sinks; natural pollution in arid land waters; distillation of waste waters: a water resource for arid regions; and animal waste runoff--a major water quality challenge. WATER QUALITY MODELING AND PREDICTION,
Kansas Water Resources Research Inst., Manhattan.
E. S. Lee, L. E. Erickson, and L. T. Fan.
Available from NTIS as PB-198 127, $3.00 in paper copy, $0.95 in microfiche. KWRRI, Kansas Water Resource Research Institute, Contribution No 52, January 1971. 78 p, 9 tab, 21 fig, 24 ref, append. OWRR Project B-015-KAN (2).

Descriptors: Biochemical oxygen demand, *Water quality control, *Model studies, *Forecasting, Mathematical models, Water pollution control, Dispersion, Dissolved oxygen.
Identifiers: Parameter estimation, Axial dispersion, Quasilinearization, Invariant imbedding, Nonlinear filtering.

The recently developed modeling and forecasting techniques such as quasilinearization and invariant imbedding are applied to the modeling of water quality systems. Due to the fast convergence rate and the sequential nature of the estimation scheme, a large amount of computer time and computer memory can be saved. Furthermore, these approaches form an effective forecasting technique for the prediction of pollutant concentration. The dispersion model with the consideration of axial mixing is used. By properly adjusting the axial diffusion coefficient, the dispersion model can represent streams with any degree of mixing. A water stream with intermediate reservoirs, and with waste discharges and water intakes along the stream, is represented by a system of second order differential equations. These equations are obtained by dividing the stream into different segments. An analytical solution is obtained for this system of equations to predict the BOD and DO concentrations. Based on this model, simulation study is also carried out to investigate the influence of the various parameters on the BOD and DO profiles.

MARGINAL COSTS OF ALTERNATIVE LEVELS OF WATER QUALITY IN THE UPPER MISSISSIPPI RIVER,
Minnesota Univ., St. Paul.
Robert Lewis Lewis.
Water Resources Research Center, Bulletin 25, University of Minnesota, Minneapolis, Minnesota, September 1970. 59 p, 12 fig, 6 tab. OWRR Project A-019-MINN (2).

Descriptors: *Water quality, *Marginal costs, Management, Waste treatment, Treatment facilities, Dissolved oxygen, Cost analysis.
Identifiers: *Treatment expenditures, Analytic framework, Environmental problems, Upper Mississippi River, Twin Cities.

The purpose of this study is to identify the physical, institutional and economic interrelationships that affect and are affected by the quality of the water in the Mississippi River in the Twin Cities area. The

hypothesis tested in the thesis is that a cost minimizing management plan can be devised which will maintain the current dissolved oxygen (DO) river standard in the study area in a manner that is both physically and economically feasible under exisitng conditions. (A management plan is assumed to be economically feasible if the increase in the total annual cost of treatment does not exceed 10% of the present annual expenditure.) If the hypothesis is accepted, then the Sewer Service Board could maintain the DO river standard at a moderate increase in annual treatment expenditure by providing a more efficient allocation of treatment among the five treatment plants. The objectives of the study include: (1) identify the physical, institutional, and economic conditions related to water quality; (2) propose an analytical framework for combining the physical properties of the river with costs of treatment; (3) determine the highest possible DO river standard feasible with existing treatment facilities during summer low flows; (4) test hypothesis that minimum cost management scheme can be found which will maintain the current DO river standard in a manner both physically and economically feasible under existing conditions. It is concluded that the change in the institutional structure adopted by the Minnesota League will lead to a more efficient allocation of treatment expenditures at the five treatment plants. IMPLICATIONS OF WATER QUALITY LAWS FOR THE FEEDLOT INDUSTRY,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Economics.
Ron E. Shaffer, and Daniel E. Badger.
Oklahoma Current Farm Economics, March 1970, Vol 43, No 1, p 3-11. 2 tab, 19 ref.

Descriptors: *Water pollution control, *Pollution abatement, *Water management (Applied), *Water Quality Act, *Environmental effects, Lagoons, Water pollution effects, Waste disposal, Cost sharing, Legal aspects, Social aspects, Fertilizers, Benefits, Arid lands, Dry seasons, Waste dilutions, Stabilization, Dissolved solids, Oklahoma, Texas, Return (Monetary), Profit, Water utilization, Productivity, Streams, Legislation, Cattle, Water treatment, Waste treatment.
Identifiers: *Quality alteration, *Trade off, *Feed lot industry, *Beef feeding industry, *Feed Yards Act.

Agricultural water users historically considered the amount of wastes and impurities that could be discharged; recent emphasis is to keep pollutants from streams. Feedlot operators must integrate and coordinate the total production process to efficiently use resources for a profitable return. They must know what legal and social requirements they have in environmental protection through water management. Large-scale operations in Texas and Oklahoma, with up to 40,000 head capacity, predominate the beeffeeding industry. The Water Quality Act and Feed Yards Act require elimination of interstate water pollution and water-resource enchancement. Oklahoma requires feedlot licensees to provide reasonable waste disposal and drainage to avoid pollution. Feedlot runoff is discussed in terms of removing undesirable solids by stabilization lagoons and dilution. These methods present special problems in dry seasons and in arid lands. Waste disposal of manure as fertilize sales is not economical, but social and legal benefits of pollution-free rivers are high. Cost sharing waste control projects are outlined. Future feedlot locations must consider access to waste disposal as well as beef markets. Environmental quality is a dimension new to the industry, which will be developed when society can tradeoff between production efficiency and environment, or develop cost-sharing programs. INDUCED AIR MIXING OF LARGE BODIES OF POLLUTED WATER,
Maine Univ., Orono. Dept. of Chemical Engineering.
Stefan A. Zieminski, and Raymond C. Whittemore.
Copy available from GPO Sup Doc as: I67.13/4: 160800WP, 11/70, $.0.60; microfiche from NTIS as PB-198 220, $0.95. EPA-WBO Report No 16080 DWP, Nov 1970. 46 p, 32 fig, 5 tab, 26 ref.

Descriptors: *Aeration, *Water quality control, *Air entrainment, Coalescence bubbles, Mixing, Diffusion, Tracers.
Identifiers: Air plume, Energy input.

Induced air mixing of large bodies of water was investigated. The objective was to conduct a pilot-scale study to estimate the effects of variables such as the air flow rate, geometry of the body of water, energy input, size of air bubbles, and the pumping capacity of the air plume on the time of mixing. The latter was defined as the time required to reach 90% of the equilibrium concentration of the KCl tracer. In the study emphasis was put on the direction and relative magnitudes of the variables in order to obtain guidelines for large-scale investigation. Considerable time was spent on the development of the various experimental techniques. The tests were conducted in a plexiglas tank of 180 gallons capacity. It is stressed that the induced air system was investigated only from the viewpoint of its mixing performance. Its effect on aquatic life was not considered.

Karl A. Roseman, and Warner M. Linfield.
Copy available from GPO Sup Doc as EPA-WQO Report No 16080 DVF, December 1970, $1.00; microfiche from NTIS as PB-198 222, $0.95. 103 p, 4 tab, 10 ref. EPA-WQO Contract 14-12-575.

Descriptors: *Detergents, *Algal control, *Formulation, *Surfactants, *Eutrophication, Linear alkylate sulfonates, Chelation, Phosphates, Organic compounds, Water pollution control.
Identifiers: Phosphate-free detergents, Trisodium nitrilotriacetate, Sodium citrate.

Basic studies were performed towards the development of phosphate-free home laundry detergents. Five surfactants were synthesized with the idea that they might possess hard ion chelating properties. The cleaning abilities of these materials were compared to the widely used linear alkylbenzene sulfonate as incorporated into the same formulations. The detergent compositions contained 2% carboxymethylcellulose and the silicate content was varied. Sodium acetate and sodium carbonate were investigated as possible reservoirs of alkalinity. Surfactant compatibility with sodium chloride and sodium sulfate was examined. Other additives included trisodium nitrilotriacetate and sodium citrate at moderate levels. Fifteen detergent formulations were screened and the results leave little doubt that acceptable phosphate-free home laundry detergents can be developed.

Descriptors: *Pesticide removal, *DDT, *Reduc tion (Chemical), Chlorinated hydrocarbon pesti cides, Soil environment, Waste water treatment Pesticide residues.
Identifiers: *Pesticide degradation Polychlorinatedbiphenyls, PCB, DDE.

Laboratory studies demonstrated the feasibility o controlled destruction of chlorinated pesticide such as DDT. The concept comprised (1) means t degrade DDT to a harmless form, and (2) method to delay the reaction for given pest-control action Chemical methods for degrading DDT were screened and reduction was selected as the mos promising technique. Destruction of DDT, withou forming DDE as a product was demonstrated by mildly acidic reduction with zinc powder. The principal product is bis (p-chlorophenyl)ethane, DDT with all three aliphatic chlorines removed; a material stated to be 'void of the neurotoxic effects of DDT.' Catalysis of the reaction resulted in complete destruction of DDT in 1 hr at 25 degrees C and conversion to bis (chlorophenyl)ethane in 4-8 hrs. Catalyzed aluminum or iron reduction of DDT produced tetra (p-chlorophenyl)-tetrachlorobutane, reportedly lipoid insoluble. Reductive degradation of dieldrin, endrin, aldrin, chlordane, heptachlor, toxaphene, and selected polychlorinated biphenyls was also shown. A 90% destruction of DDT in laboratory soil was shown in 4 days by this technique. Degradation of DDT in water was demonstrated also, a 421 mg/l suspension being reduced to 1 ppm after 1 hr reaction at 75 degrees C. Reaction delay can be achieved with wax or silyl coatings which are slowly dissolved or eroded. Coatings were produced which stopped zinc-acid reaction.

INDUCED HYPOLIMNION AERATION FOR WATER QUALITY IMPROVEMENT OF POWER RELEASES,
Robert S. Kerr Water Research Center. Ada, Okla.
Lowell E. Leach, William R. Duffer, and Curtis C. Harlin, Jr.
Copy available from GPO Sup Doc as Report No 16080, October 1970, $0.50; microfiche from NTIS as PB-198 226, $0.95. Report No 16080, October 1970. 32 p, 15 fig, 2 tab, 21 ref.

Descriptors: *Aeration, *Thermal stratification, *Impoundments, *Hypolimnion, Dissolved oxygen, Mixing, Oxygenation, Air entrainment, Thermocline, Epilimnion.
Identifiers: *Water quality control, *Induced aeration, *Reservoir destratification, Air distribution system, Oxygenation efficiency, Power release aeration.

Conventional hydraulic structures in most dams withdraw low flow and power releases from the poor quality hypolimnion waters during summer stratification resulting in serious degradation of long reaches of streams below dams. Induced aeration of hypolimnion waters during summer stratification has great potential in water quality management of power releases, low flow releases, and limited volumes of impoundments without costly modification of existing outlet works. Hypolimnion aeration research on power discharge quality improvement was conducted at Eufaula Reservoir in southeastern Oklahoma during the summer of 1968. Dissolved oxygen transfer efficiency of the aeration system ranged from 1.8 to 3.0 pounds of dissolved oxygen per horsepower-hour of expended energy resulting in an operating cost of 4.10 to 6.25 dollars per 1,000 pounds of oxygen incorporated into the power releases. Additional research for development and optimization of the induced aeration system is discussed. (Leach-EPA-WQO)

ntifiers: *Carbonate bonding, *Coal refuse der.

aboratory study of the variables which affect the perties of the carbonate bonded coal refuse has n made. The carbonate bonding process utilizcoal refuse as a fill material consists of mixing l refuse with water and lime hydrate, compactthe mixture, and reacting it with a carbon-dioxrich gas to form a coherent structure bonded by atrix of calcite crystals. The resulting carbonate ded coal refuse can be used in road building or coal refuse pile sealant to minimize acid mine er pollution. Four types of coal refuse were iigated--a relatively unoxidized and highly oxed bituminous coal refuse and a relatively unoxed and highly oxidized anthracite coal refuse. It found that compressive strengths of 2200 to 0 psi were obtained for the four types of coal se investigated using up to 12 percent lime rate and 9 to 15 percent water. In general, the pressive strength of the carbonate bonded coal se increases with increasing lime hydrate con- reaction time and carbon dioxide concentrain the carbonate bonding reaction gas. The air water permeability of carbonate bonded coal se was found to be comparable to concrete. An oximate cost comparison between carbonate led coal refuse and other construction materiand techniques indicated that the carbonate ling process utilizing coal refuse is the least means available for coal refuse pile sealing and building. iptors: *Interstate compacts, *Interstate issions, *Sewage treatment, *Administrative ies, Administrative decisions, Cities, Sewage ts, Local governments, Federal government, ylvania, Water sources, Wells.

The Delaware River Basin Commission published notice of hearings to amend the Comprehensive Plan. Proposed amendments to expand the Comprehensive Plan are: (1) a modification of the existing treatment plant in Haverford Township, Pennsylvania to remove 90 per cent of BOD5 from 5.4 million gallons per day of sewage flow prior to discharge in Darby Creek; and (2) utilization of two existing wells as emergency water sources for Bethelehem, Pennsylvania. GOVERNMENTAL RESPONSIBILITY FOR WASTE MANAGEMENT IN URBAN REGIONS,
Richard T. Anderson.
Natural Resources Journal, Vol 10, No 4, p 668-686 (Oct 1970). 19 p, 1 tab, 30 ref.

Descriptors: *Wastes, *Integrated control measures, *Regional analysis, *Municipal wastes, Federal government, State governments, Local governments, Inter-agency cooperation, Institutional constraints, Political constraints, Interstate, Planning, Political aspects, Administration, Coordination, Decision making, Domestic wastes, Regions, Environmental sanitation, Waste disposal, Waste water disposal, Waste treatment, Non-structural alternatives.

The allocation of governmental waste management responsibility is analyzed in this article. Four premises are employed in the analysis: (1) waste management is a collective, public responsibility; (2) solid, liquid, and gaseous wastes are related; (3) the urban-waste problem is regional; and (4) intergovernmental action is required. The three issues examined are: (1) determination of environmental quality levels, costs, and benefits, (2) ascertainment of the most efficient managerial system; and (3) the respective roles of the federal, state, regional and local governments. Determining national environmental policy and providing a financial commitment to the policy is held to be the role of the federal government. The state roles are said to include policy development on a state level and the design and operation of waste-management programs in cooperation with local governments. The desirability and scope of regional authority in fulfilling state responsibilities is analyzed in the light of four criteria: (1) geography, (2) desirable levels of operational authority, (3) functional duties, and (4) metropolitan representation. Six alternative approaches to regional waste management are presented by the author. (Earl-Florida)

RUBBER TANKS AID SEWAGE FIGHT,
Jonathan Eberhart.
Sci News, Vol 94, No 5, p 115, Aug 3, 1968.

Descriptors: *Construction materials, *Construction costs, Storm runoff, Overflow.
Identifiers: *Storm overflows, Rubber storage containers, Washington, D.C.

In Washington D.C.'s Anacostia River, a new technique is being tried to eliminate pollution of the river caused by sewage overflows during severe rainstorms. This new method is less expensive than Chicago's underground sewer project which will cost almost $15 million for the pilot project and more than $2 billion for city-wide installation. In Washington, large rubber tanks will be anchored beneath the surface of the Anacostia. Stormwater and sewage overflow will be diverted to these tanks and stored there until the water has receded, and the tanks' contents can be pumped to the nearby sewage treatment plant.
W71-06290

WATER POLLUTION CONTROL. 5 BILLION DOLLARS TAB,
C. Laverty.
Rubber World, Vol 160, No 1, p 48-49, Apr 1969.

Descriptors: *Rubber, *Biocontrol, Water pollution control, Construction materials.
Identifiers: *Rubber storage containers, Rubber gates, Acid-resistant hose.

A summary is given of various uses of rubber for combatting water pollution. Chunks or strips of rubber compounds containing relatively insoluble organo-metallic compounds or alkanolamine salts of salicylanilides as toxicants are dropped into contaminated water for biocidal action lasting one year or more. Other antipollution methods employ: giant (100,000 gal) rubberized Pillow tanks, used as temporary storage for sewage overflow triggered by heavy rains; nylon-reinforced polychloroprene Fabridam rubber gates for storm control; and acid-resistant hose, for carrying pickle liquor to storage tanks for treatment and ultimate disposal in underground sandstone reservoir.

IT'S IN THE BAG.

Am City, Vol 84, No 4, p 88, Apr 1969.

Descriptors: *Storage tanks, Overflow, Storm runoff, Ohio.
Identifiers: *Rubber storage containers, Combined sewers, Storm tank.

The problem of stormwater overflows from combined sewers is being combatted in Sandusky, Ohio through the implementation of a plan which is much less costly than the common solution of sewer separation. The new system consists of rubberized storage reservoirs that trap the heavily-polluted 'first flush' of stormwater. When the storm ends, pumps transfer the stored stormwater to the treatment plant for processing along with the normal waste water. Costs, details, and a diagram of the system are included in the article.

STORMWATER OVERFLOW GETS BAGGED.

Eng News-Record, Vol 181, No 18, p 14, Oct 31, 1968.

Descriptors: *Construction equipment, *Construction costs, *Separation techniques, Overflow.
Identifiers: *Rubber storage containers.

The FWPCA is financing projects to install rubber stormwater storage bags at three locations: Washington's Anacostia River, Sandusky, Ohio at Lake Erie, and Cambridge, Md.'s Choptank River estuary. The bags will store stormwater overflow that normally flows untreated into rivers and lakes along with sanitary sewage, when flows exceed treatment plants' capacities during heavy rainfall. The Washington bags rest on the bottom of the Anacostia River offshore of the pumping plant. The plant will chop overflow solids before the water reaches the bags, and an aerator will suspend the solids. The solids come out with the stored water when it is pumped back into the sewers for treatment. These plans are considerably less costly than sewer separation which would cost an estimated $48 billion to accomplish throughout the United States.

STORAGE BLADDERS FOR SEWAGE.

Ind Water Eng, Vol 5, No 8, p 30, Aug 1968.

Descriptors: *Construction equipment, *Rubber, *Storage tanks, Storm runoff, Overflow.
Identifiers: *Rubber storage containers, *Anacostia River.

Two large 100,000 gallon tanks of nylon-impregnated rubber have been anchored in metal cradles on the bottom of the Anacostia River. During rainfall the tanks are used to hold overflow and later, when the water has receded, the tanks are emptied and their contents pumped easily to the sewage treatment plant. These tanks have also been used for holding fuel, water, oil, beer, and wine.

COMBINED SEWER SOLUTION SOUGHT IN SANDUSKY FIELD DEMONSTRATION.
Water Sewage Works, Vol 116, No 10, p 386-387, Oct 1969.

Descriptors: *Overflow, *Construction materials, Storm runoff.
Identifiers: *Storm overflows, Rubber storage containers, Storm tank, Sandusky, Ohio.

The use of flexible rubber containers for off-shore underwater temporary storage of storm overflow from a combined sewer has been proposed for the Sandusky Bay area as the answer to its storm overflow problems. The containers are predicted to temporarily hold overflows equivalent to a one-year storm. When the plant can handle the excess, the contents of the containers are pumped back to the plant where the sewage is treated and piped into the bay.

STORM WATER STORAGE SCHEME.

Water Waste Treat, Vol 12, No 7, p 221, May/Jun 1969.

Descriptors: *Construction materials, *Storm runoff.
Identifiers: *Rubber storage containers, *Storm overflows, *Sandusky, Ohio, Storm sewage.

A pilot project to study the storage of storm sewage from combined sewers at Sandusky, Ohio, is described. Two 100,000 gallon collapsible fabric-reinforced rubber tanks have been installed on the bottom of Sandusky Bay; the tanks will fill by gravity and will temporarily store overflows equivalent to a 1-year storm on a small area. Subsequently the storm sewage will be pumped to the works for treatment and discharged to the bay between storms.

APPLIES EXISTING TECHNOLOGY FOR A CLEANER LAKE ERIE.

Am City, Vol 85, No 4, p 18, Apr 1970.

Descriptors: *Waste treatment, *Storage, Instrumentation, Storm runoff.
Identifiers: *Lake Erie, Monitoring system, Stormwater storage.

The Detroit Metropolitan Water Service is putting existing technology into effect to help decelerate the aging of Lake Erie. Proposed programs include: solids reduction by addition of mechanisms to the regional waste water plant, coliform removal through chlorination, phosphate reduction using pickle liquor from steel mills, waste oil and grease removal using oil skimmers, construction of phenol-removing systems, and installation of smokestack air cleaners to prevent air pollution. A monitoring system to reduce stormwater overflows is also being built to warn of approaching rainfall, thus allowing sewers to be pumped before the storm. This will permit sewers to store contaminated stormwater, the dirtiest water being sent to the treatment plant. Further long range plans are being made to meet future demands of the region.

STEPS TO SUCCESS IN WATER POLLUTION CONTROL,
Charles V. Gibbs.
Public Works, Vol 101, No 5, p 62-67, May 1970.

Descriptors: *Overflow, *Pollution abatement, *Sludge digestion, Sewage treatment, Separation techniques.
Identifiers: *Interceptor sewer, *Seattle, Combined sewers.

Plans and actions of the Municipality of Metropolitan Seattle (Metro) in regard to combatting the city's water pollution problems are presented. Metro has devised various solutions to underground construction problems with pipelines and pumping stations. Other problems tackled by Metro include the removal of digested sludge from Puget Sound and the elimination of combined sewer overflows. Sewer separation is not presently feasible because of the expense, so the Metro interceptor system is being ordered to run the entire system. In the meantime, money originally reserved for storm water holding tanks is being contributed to the city's proposed sewer separation system. Metro is continuing its innovative engineering programs and is coordinating its activities with community agencies working in the same or related fields.

L. L. Lowry.
Am City, Vol 83, No 6, p 108-109, Jun 1968.

Descriptors: *Reservoir storage, Storm runoff.
Identifiers: *Stormwater control.

State College, Pa. constructed a reservoir to contain runoff until after a storm instead of installing a more costly water-carrying conduit. An electrically contolled gate closes when rain causes the water level in the reservoir to rise, and it opens when the storm subsides, thus, allowing the rainwater to drain. As a part of State College's sewage project, a new storm trunk line was built contrary to common practice; that is, from the center of the job downstream, to reduce the threat of the pipe coming afloat in the event of a flash flood. This plan was also successful; flood water was forced inside the pipe rather than flowing around the outside and causing flotation. State College also formed a Storm Water Authority to undertake the financing of such storm water control project.

THE SEWER HAD TO BE CLEANED BEFORE SNOWFALL,
Charles Knecht.
Am City, Vol 84, No 10, p 120 and 123, Oct 1969.

Descriptors: *Maintenance, *Sewers, Hydraulics.
Identifiers: *Sewer cleaning, Sewer hydraulics.

In Houghton, Michigan, a cold-climate town, water pollution and sewage problems are serious due to the sand and grit from street traction abrasives, which enter sewer interceptors during rain and spring thaw conditions. Not only do the interceptors become clogged and sewers inoperable, but public health is threatened by unclean water developing from overflow bypassing treatment. The town hired a company this year to utilize traditional cleaning techniques to unclog the sewer system. The line was only two years old and designed to self-clean, but preventive maintenance programs are necessary for all sewers in cold-climate towns like Houghton.

NOTES ON WATER POLLUTION.
Inst Sewage Purif, J Proc, Part 2, p 199-202, 1966. 1 graph, 3 ref.

Descriptors: *Sewers, Investigations, Sewage, Water pollution, Runoff, Storage tanks.
Identifiers: *Storm sewage, *Combined sewers, *Storm overflows, Great Britain.

Studies were performed in three areas served by combined sewerage systems on the amount, com-

position, and pollution load of stormwater overflows. There was regularity in the volume of storm sewage at the three sites in relation to impermeable area, total rainfall, and dry-weather flow; however, no regularity was detected in composition. Generalizations were made regarding runoff, sewage dilution, single storm discharges, etc., and specifics for each locale were also described. Recommendations were made for the placement of storage tanks alongside of storm overflows and for experimentation in designing different types of overflows in order to reduce pollution load discharges.

COMPUTERS IN HONG KONG PUBLIC WORKS,
A. T. Armstrong-Wright.
Surveyor, Vol 84, No 4029, p 34-39, Aug 22, 1969. 12 fig.

Descriptors: *Computers, *Computer programs, *Project planning, Highways, Water supply, Expenditures, Sewage disposal, Design, Hydrologic data.

This article describes applications of electronic computers to public works projects in Hong Kong. Their feasibility is obvious due to their speed and accuracy. Applications of computers are discussed for the following areas: project scheduling; highways (road alignment, flyover beam design, pile loading and setting-out road curves and flyovers); water supply (hydrologic data, dam stability analyses, flood balancing reservoirs, yield of water supply schemes, operation of reservoirs, and project appraisal); and expenditure control. In the area of sewage disposal, computers aid in developing suitable designs for multi-port diffusers on ends of submarine outfalls. Computers also process hydrologic data which engineers use in water management and operation of existing facilities. The author concludes that as time progresses, increased use will be made of computers, not only in sophisticated studies but also in day-to-day operations.

INTRODUCTION: ISSUES IN FOOD PRODUCTION AND CLEAN WATER,
Agricultural Research Service, Beltsville, Md. Water Conservation Research Div
Cecil H. Wadleigh, and Clarence S. Britt
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Introduction, p xix-xxvii. 1 tab, 3 fig, 4 ref.

Descriptors: *Farm wastes, *Environment, Cattle, Poultry, Hogs, Ammonia, Fertilizers, Nitrogen, Corn, Labor, Nutrients, Potassium, Biochemical oxygen demand, Runoff, Fishkill, Effluent, Pesticides, Coliforms, Nitrates, Eutrophication, Phosphorus, Oxygen, Fish, Conservation, Lagoons, Odor, Sprinkler irrigation, Water quality
Identifiers: *Waste production, *Feedlots, Mechanization, Chicken litter

The article introduces the subject matter and content of the book. A look is first taken at the increased consumption of meat in this country. From the total number of animals raised for slaughter, an idea is given of the amount and scope of the animal waste disposal problem. To raise this large number of animals the agricultural industry has relied on a variety of chemical fertilizers and pesticides to increase yields. Runoff from feedlots and agricultural lands has caused eutrophication and associated fish kills. However these are not the only nutrient sources. Conservation practices are needed to prevent water flowing through feedlots to run directly into a water course. As such secondary or even tertiary lagoons may be required. Recycling of wastes should be the optimum means of disposal. Sound conservation farming is needed to assure beneficial use of agricultural wastes and to effectively protect the quality of water in our streams and reservoirs. LAND AND WATER MANAGEMENT FOR MINIMIZING SEDIMENT,
Iowa State Univ. Ames. Dept. of Agronomy.
Minoru Amemiya.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 3, p 35-45. 5 tab, 28 ref.

Descriptors: *Land management, *Water management, *Sediments, *Soil erosion, Sediment yield, Soil stabilization, Sediment transport, Energy dissipation, Soil properties, Slopes, Farm management, Infiltration, Storage capacity, Vegetation, Velocity, Flow, Mulching, Erosion control, Cultivation, Runoff, Strip cropping, Terracing, Contour farming.
Identifiers: Detachment, Universal Soil Loss Equation.

The most logical and direct approach to solving our agriculturally related sediment problem is the stabilization of the sediment source by controlling soil erosion through the use of proper land and water management practices. An understanding of the factors affecting soil erosion by water is required in order to effectively protect the soil. The Universal Soil Loss Equation provides a framework for discussing erosion control measures. A vegetative cover or surface mulch is one of the most effective means of controlling runoff and erosion, and is discussed in some detail. A natural result of this fact is the creation of tillage methods which leave a mulch or crop residue on the surface. Examples of their effectiveness in controlling soil erosion are given. Contour farming, strip-cropping and terracing are slope modification methods for erosion control. Slope modification measures combined with soil conserving tillage practices can be effective in reducing soil erosion from cropped land. However, to become widely accepted, such practices must fit efficient farming operations and must be economically feasible. (See also W71-05437) (White-Iowa State)

FERTILIZER MANAGEMENT FOR POLLUTION CONTROL,
Minnesota Univ., St. Paul. Dept. of Soil Science.
W. P. Martin, W. E. Fenster, and L. D. Hanson.
Miscellaneous Publication Paper No 1360 of the University of Minnesota Agricultural Experiment Station, St. Paul. Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 9, p 142-158. 68 ref.

Descriptors: *Fertilizers, *Nitrogen, *Phosphorus, Nutrients, Phosphates, Soil erosion, Sedimentation, Sediments, Soils, Water supply, Eutrophication, Cultivation, Nitrates, Farm wastes, Wells, Water pollution, Nitrification, Irrigation, Denitrification.
Identifiers: *Pollution control, *Fertilizer use, Nutrient removal, Feedlots.

Nitrogen and phosphorus, as nutrient elements, are important to both land and aquatic plants, and normally reach water supplies via land runoff in the erosion debris. Fertilizer usages in the midcontinent area are rapidly increasing to maximi production and increase efficiency, and further creases are expected. Fertilizer phosphorus quic converts to unavailable forms in mineral soils a the evidence indicates that one of the ways reducing the level of soluble phosphorus in wa would be to effect soil contact such as by filtrati through the soil medium. Nitrogen fertilizer app cation rates should approximate crop needs, wh for a given soil type and climatic zone are based production potential estimates for the crops to grown. Management recommendations refin through the years for maximizing production a not incompatible with the objective of reduci nutrient contamination of natural waters. Furth research is needed on nutrient balances and re tions in soils to maintain supplies at levels need for crop production. Water quality standards established by the federal and state water polluti control groups should be compatible with the ne for maintaining adequate nutrients for efficie crop production consistent with management pr grams designed to minimize losses to adjace water supplies. The force of the law has not been brought to be on agriculture as it has on other major sources water pollution. Agricultural pollution has thus f been ignored because it is less visible and more di ficult to correct than are wastes from municipaliti and industry. Currently only those types of agricu tural pollution that are obvious and subject t direct control receive legal attention. As poi sources are brought under control, agriculture more subtle contributions to water pollution will a

tract regulatory concern. Public regulation of agricultural pollution will take two primary forms: (1) direct restrictions on the use of chemical inputs to agricultural production, and (2) regulation of land use patterns and practices. Examples of the first type of regulation are prohibitions or limitations on the use of certain chemical biocides, fertilizers, and other additives. Land use regulations seem very likely to be necessary to effect a meaningful reduction in soil erosion. The ideal construct might involve the employment of land-use controls by a comprehensive watershed management authority. If this does not come to pass, exercise of such powers by other local districts such as soil conservation districts, conservancy districts, or drainage districts would be feasible, as would granting similar powers to the local pollution control agency. ECONOMIC ASPECTS,
Iowa State Univ., Ames. Dept. of Economics.
John F. Timmons.
Journal Paper No J-6469 of the Iowa Agricultural and Home Economics Experiment Station, Iowa State University, Ames, Iowa. Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 27, p 377-389. 9 ref.

Descriptors: *Water quality, *Economics, Management, Water quality control, Water resources, Costs, Benefits, Standards, Measurement, Water Quality Act.
Identifiers: *Quality levels, *Water supplies quality, *Water demand quality, Least cost method, Externalities, Public intervention, Water quality management, Quality use.

The first step toward meeting water quality management relating to water use within agriculture is being taken through becoming aware of the importance of water quality problems. The need to recognize the quality heterogeneities of water from demand and supply orientations is evident. The importance of demand orientations and requirements is paramount in specifying quality standards which vary among uses, spatially and temporally. Supply qualities must be geared to qualities demanded by uses. Least-cost methods are necessary in meeting demand qualities. In assigning benefits and costs to water uses, the problems of externalities, measurement, and intervention are crucial. Economics with its legacy of methods, theory, and its corps of resource economists is a necessary part of the multidisciplinary approach in planning and in carrying out relevant research necessary for education, legislation, and administration of water quality management. ALLIANCE FOR ACTION,
Federal Water Pollution Control Administration, Kansas City, Mo. Missouri Basin Region.
John M. Rademacher.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970, Chapter 3, p 390-396. 10 ref.

Descriptors: *Farm wastes, *Water pollution, Agriculture, Fishkills, Pesticides, Sediments, Runoff, Regulation, Zoning, Management, Waste treatment, Dissolved oxygen.
Identifiers: *Feedlots, *Technical base, *Inventory, Registration, Feedlot runoff, Animal waste management, Quantities, Runoff strength, Population equivalent.

The author chooses to look at animal wastes since as pollutant lends itself to more classical solutions than do other agricultural pollutants. He then ices together the various interests involved with the animal waste problem. A technical base of information is required to establish effective controls. The development of an inventory noting animal production, concentration and location is an essential element of the technical base for the animal waste problem. Specific research and development needs must be delineated in accordance with the expected trends of the feedlot industry. Regulations are needed to ensure feedlot operators that measures they employ will guarantee a reasonable tenure of operation. Zoning regulations may be necessary and desirable. Mandatory registration should be an integral part of feedlot regulations. A sound animal waste management program encompasses prevention, reduction, treatment, and disposal of animal wastes. No one treatment process or system will be the solution for all animal production units. A variety of management and treatment systems will have to be developed. If it is the public who must bear the cost, then agriculture must have the courage to include waste treatment as a part of its production costs. (See also W71-05437) (White-Iowa State)

ACCOMPLISHMENTS AND GOALS,
Federal Water Pollution Control Administration, Washington, D.C. Agricultural and Marine Pollution Control.
Harold Bernard.
Agricultural Practices and Water Quality, Iowa State University Press, Ames, Iowa, 1970. Chapter 29, p 397-407. 2 fig, 1 tab, 2 ref.

Descriptors: *Water pollution, *Water quality, *Standards, Environment, Research and development, Management, Water Quality Act, Nebraska, Water supply, Water utilization, Water sports, Pollution abatement, Biochemical oxygen demand, Sewage treatment, Farm wastes, Nutrients, Return flow, Expenditures.
Identifiers: *Federal Water Pollution Control Administration, Agricultural pollution.

The article gives information as to the scope and extent of FWPCA activities relating to the control of agricultural pollution. Over $4 million has been expended in 1969 and 1970 on research and demonstrations involving pollution abatement from pesticides, nutrient runoff, irrigation return flows and feedlot operations. An example of criteria for water quality standards is given. Recommendations from a recent task force of seven cognizant Federal agencies studying the agricultural pollution problem are given. Data is presented indicating the need for municipal, industrial and agricultural pollution control. New techniques and systems must be developed to increase the quantity of pollutants removed from these sources before it reaches our streams. (See also W71-05437) (White-Iowa State)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

UNDERSTANDING SYSTEMS ENGINEERING,
Lockheed-California Co., Burbank.
E. J. Kovalcik.
J Syst Manage, Vol 21, No 9, p 15-21, Sept 1970. 7 p, 3 fig, 8 ref.

Descriptors: *Systems engineering, *Methodology, *Objectives, Ideas, Management, Requirements, Analytical techniques, Optimization, Models, Benefit-cost analysis, Systems analysis, Project planning, Scheduling, Feedback, Procedures, Performance, Decision making.

The Systems Engineering (SE) method recognizes that each system is an integrated whole even though composed of diverse, specialized structures and subfunctions. The method also recognizes that any system has several objectives and that the balance between them may differ widely from system to system. The SE methods seek to optimize the overall system functions according to the weighted objectives and to achieve maximum compatibility of its parts. The major steps in SE that can be helpful in setting up a conceptual definition for management are: (1) definition of the operational requirement, (2) development and evaluation of new concepts and techniques, (3) study of tradeoffs, (4) definition of performance goals and interfaces, and (5) systems management--the art of tying the whole thing together. The article contains a general discussion about: systems and subsystems, basic concepts and ideas of SE, terms common to SE, objectives for SE, and SE implementation and management. SE, properly applied and implemented, will give management the best opportunity to manage technical programs with maximum visibility, and when coupled with schedules, cost, and risk inputs, can become as close as possible to optimum management. WATER RESOURCES SYSTEMS ANALYSIS OF DISCRETE DIFFERENTIAL DYNAMIC PROGRAMMING,
Illinois Univ., Urbana. Dept. of Civil Engineering.
M. Heidari, V. T. Chow, and D. D. Meredith.
Civil Engineering Studies, Hydraulic Engineering Series, No 24, (UILU-ENG-71-2008), January 1971. 118 p, 15 tab, 21 fig, 30 ref, 2 append. OWRR Report B-030-ILL (4).

Descriptors: *Systems analysis, *Optimization, *Dynamic programming, *Planning, Reservoirs, Irrigation, Hydroelectric power, Invertible systems.

The optimization of operating policies of multiple-unit and multiple-purpose water resources systems by traditional dynamic programming with the use of high-speed digital computers encounters two major difficulties: excessive memory requirements, and tremendous amounts of computer time requirements. This report describes an iterative method named discrete differential dynamic programming (DDDP) which can ease the above difficulties considerably. The method starts with a trial trajectory satisfying a specific set of initial and final conditions and applies Bellman's recursive equation in the neighborhood of this trajectory. At the end of each iteration step a locally improved trajectory is obtained and used as the trial trajectory in the next step. It is shown that the method is particularly effective in the case of so called 'invertible' systems. The merits of the proposed approach are demonstrated through its application to two four-unit, two-purpose water resources systems. To save computer time the examples are restricted to deterministic hydrologic inputs.

A MODEL OF PUBLIC DECISIONS ILLUSTRATED BY A WATER POLLUTION POLICY PROBLEM,
Resources for the Future Inc., Washington, D.C.
Robert Dorfman, and Henry P. Jacoby.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 173-231, 1970.

Descriptors: *Decisionmaking, *Water pollution, *Mathematical studies, *Water quality, *Cost benefit analysis, Optimization, Data, Management, Government, Rivers, Sewage, Costs, Technology, Taxes.
Identifiers: *Pareto optimality, *Political decision process, Linear programming, Canneries.

This article attempts to present a complicated problem of government decision-making in terms of a formal model. The hypothetical case devised for this purpose incorporated many of the salient features of real water pollution control problems

including a wide variety of hydrologic, technical, social, political and economic issues. Deep seated conflicts of interests among the participants was also incorporated. The model was implemented and provided intelligible results. The model utilized such data as became available and then provided a method of analyzing the way different assumptions would affect various plans likely to be adopted by the decision-making commission. It incorporated information about the commission and also provided a framework for predicting political judgments about the various possible decisions. The model is readily applicable to the circumstances of the assumption which it was based, namely that a water pollution control commission is responsive to the wishes of its constituency. The mathematical analysis presented in this article is designed to be of assistance in understanding and facilitating the lengthier and more cumbersome decision-making processes in current use. QUANTITATIVE ANALYSIS IN PUBLIC FINANCE,
York Univ. (England).
Alan T. Peacock.
New York, Praeger Publishers, 266 p, 1969.

Descriptors: *Economic efficiency, *Cost-benefit analysis, *Mathematical studies, Decisionmaking, Taxes, Statistics, Budgets, Forecasting, Fishing, Income, Time, Social aspects, Surveys.
Identifiers: *Quantitative analysis, *Public finance, *Quality problems, *Econometric analysis.

This book consists of a series of studies of the various aspects of quantitative analysis. The studies presented offer a useful concept of the whole area of quantitative analysis to economists generally, and especially to researchers in the field of public water resources. Areas treated in the book are survey research, statistical measures, cost-benefit analysis, measuring efficiency, econometrics of taxation, budget effects and fiscal performance in developing countries. Each topic is presented and then analyzed for both strengths and weaknesses. Practical suggestions are offered for the successful use of quantitative analysis in intelligent policy-making. Four areas requiring improvement are cited; namely, the theory of incidence and application of cost-benefit studies, the development of data on measures linking policy to endogenous economic response, experimental design, and linkages between model-building and policy-making. OPTIMIZATION TECHNIQUES FOR WATER RESOURCE SYSTEMS,
Washington State Water Research Center, Pullman.
David L. Schreiber
Washington State University, State of Washington Water Research Center, Open-File Report No 6, November 15, 1968. 48 p, 4 fig, 21 ref

Descriptors: *Engineering education, *Water management (Applied), *Model studies, *Computer models, Computer programs, Economics, Washington, California, Sampling, Data processing, Reservoirs, Water quality control, Simulation analysis, Hydrologic aspects.
Identifiers: *Water resources systems engineering, University of California at Los Angeles, Program of study, Water systems, Washington State University.

The author attended a short course entitled Optimization Techniques in Planning, Design, and Operation of Water Resource Systems at the University of California at Los Angeles in 1968, and summarizes the topics covered in the course. Linear programming, dynamic programming, and non-linear programming for water resource systems are outlined, along with advantages and disadvantages, hydrologic system models, methods of simulation, and water quality control programs. Multi-purpose water systems, supply and demand, and cost factors are summarized. On the basis of his other water resources background and what he learned in this course, the author outlines the current program of study available to a Water System Engineering major presently at UCLA; and after listing the related courses currently offered at Washington State University, suggests inclusion there of a graduate-level course entitled Water Resources Systems Engineering. GRANTS FOR PREPARATION OF COMPREHENSIVE AREA PLANS FOR WATER AND SEWER SYSTEMS.
Department of Agriculture, Washington, D.C.

Code of Federal Regulations, Title 7, Chap XVIII, secs 1823.61 thru 1823.70 (1970). 4 p.

Descriptors: *Rural areas, *Grants, *Sewerage, *Water supply, Government finances, Economics, Financing, Financial analysis, Governments, Federal government, Government supports, Allotments, Capital, Capital supply, Credit, Water resources development, Water policy, Sewage treatment, Sewage disposal, Waste disposal, Wastes Waste treatment, Water management (Applied), Planning.

The Secretary of Agriculture promulgates herein rules governing issuance of grants for preparation of comprehensive area plans dealing with water and sewer systems in rural areas. These regulations explain the following: (1) objectives of grants, (2) eligibility for grants, (3) expected content and purposes of grants, (4) technical and professional assistance for planning, and (5) procedures for processing applications for grants. State directors are authorized to approve comprehensive water and sewer planning grants when the amount of the grant does not exceed $5,000. County supervisors will supervise and service each grant to insure that the conditions of the grant are being fulfilled. (Robinson-Florida)

OPERATIONS RESEARCH STUDY OF WATER RESOURCES - PART II,
Arizona Univ., Tuscon. Dept. of Hydrology and Water Resources.
Chester C. Kisiel, and Lucien Duckstein.
Water Resources Bulletin, Vol 6, No 6, p 857-867, December 1970. 4 fig, 2 tab, 11 ref.

Descriptors: *Water resources, *Water resources development, *Methodology, *Planning, *Operations research, *Mathematical models, Systems analysis, Model studies, Data processing, Pricing.
Identifiers: *Tuscon basin, *Arizona, Pricing policies, Management models, Multiple linear regression, Discrete convolution relation.

Applications of systems methodology to water problems of the Tuscon basin are summarized. Natural recharge is estimated by means of a discrete convolution relation in which the unit impulse response of an aquifer is derived from basic hydro-dynamic laws. A temporal model of sequences of wet and dry periods during the summer thunderstorm season is based on a multiple linear regression equation that relates total rainfall amount during the wet period to the duration of the wet period and volume of peak rainfall. A spatial model predicts point rainfall frequency of maximal and minimal amounts of thunderstorm rainfall. A static management model allocates Tuscon groundwater, Avra Valley water, Colorado River water, and reclaimed waste water to municipal, industrial, and agricultural users within a pricing framework. For a range of pricing policies the model clearly demonstrates the opportunity costs to the community by use of higher-priced water supplies such as Colorado River water in lieu of Tuscon groundwater. The role of worth of data studies in relation to data analysis, model building and management studies is also introduced. (Davis-Chicago)

MODELING AND CONTROL OF THE POLLUTION OF WATER RESOURCES SYSTEMS VIA MULTILEVEL APPROACH,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Systems Engineering.
Yacov Y. Haimes.
Water Resources Bulletin, Vol 7, No 1, p 93-101, February 1971. 2 fig, 16 ref.

Descriptors: *Model studies, *Water pollution, *Water pollution control, Optimization, Mathematical models, Water resources.
Identifiers: *Water resource systems, *Multilevel optimization, Lagrange multipliers.

The problem of modeling and control of water pollution is considered. A general mathematical model, where the pollution effluent is discharged directly into the lake, or into a bypass pipe leading to an advanced Waste Water Treatment (AWT) plant, is developed. The Water resource System (WRS) under consideration is decomposed into N subsystems. The pollution effluent imput vector to each subsystem includes the water quantity and different water characteristics such as BOD, DO, pH, conductivity, temperature, algae, phosphates, nitrates, etc. Treatment cost functions and quality transition functions as well as system model constraints are introduced, where all functions can be nonlinear. A system Lagrangian is formed to incorporate the system constraints and coupling. The Lagrangian is decomposed into N independent subsystems, and a two level optimization methodology is introduced. Each subsystem is independently and separately minimized at the first level assuming known Lagrange multipliers using optimal values for effluent inputs from all subsystems obtained from the first level. Economic interpretation on the Lagrange multipliers reveals that they are merely prices imposed by the central authority (second level) for the pollution caused by the subsystems. Advantages of the multilevel approach are discussed. (Davis-Chicago)

WATER RESOURCES DEVELOPMENT IN LAOS.
Economic Commission for Asia and the Far East (UN), New York.

Water Resources Journal, United Nations Economic Commission for Asia and the Far East (ST/ECAFE/SER.C/86), p 1-44, September 1970. 44 p, 19 fig, 11 tab.

Descriptors: *Water resources development, *Surface waters, *Hydrologic data, Water supply, Water utilization, Projects, Powerplants, Irrigation, Navigation, Flood control, Costs, Foreign countries, Evaluation, United Nations.
Identifiers: *Laos.

Water resources projects in Laos concerning surface water supply, dams, reservoirs, powerplants, irrigation, navigation, flood control, and costs are discussed and hydrologic data tabulated. The Mekong river is one of the great rivers of the world. At the China-Laos-Burma border tripoint, the Mekong leaves China, and flows for 205 km between Burma and Laos, forming their border. Having entered its lower basin, the river begins its eastward swing. From this point to the Mekong-Nam Ou confluence close to the town of Luang Prabang, the river cuts obliquely across the major geological structures with the main tributaries and drainage area located in Laos on the left bank, looking downstream. From the Mekong-Nam Ou confluence, the river makes another abrupt change of course. It turns southward for 250 km through a complex geological zone of igneous and sedimentary rocks. The climate of Laos is marked by two distinct seasons, the wet season lasting from May to October, and the dry season extending from November to April. The average rainfall for the year lies in the 1,300 to 2,300 mm range depending on location. The average annual temperature ranges between 18.5 degrees and 32 degrees C according to latitude and elevation. (Woodard-USGS)

SOCIO-CULTURAL IMPACTS OF WATER RESOURCE DEVELOPMENT IN THE SANTIAM RIVER BASIN,
Oregon State Univ., Corvallis. Water Resources Research Inst.
Thomas C. Hogg, and Courtland L. Smith.
Available from NTIS as PB-198 044, $3.00 in paper copy, $0.95 in microfiche. Oregn Water Resources Research Institute Report WRRI-5, October 1970. 133 p, 9 tab, 10 fig, 65 ref. OWRR Project B-011-ORE (1).

Descriptors: Water resource development, Dams, *Social aspects, Technology, *Planning, Reservoirs, Data collection, Recreation, Population, Income, Benefits, Environment, *Psychological aspects, *Attitudes, Oregon, *Sound impact.
Identifiers: *Socio-cultural system, Social accounting, Economic development, *Santiam River Basin.

The effects of two dams on the behavioral and attitudinal patterns of Santiam residents are studied. The development of the dams from preconstruction through construction to postconstruction provided the background for the environmental and technical changes being studied. Data on these changes in relation to the local socio-cultural system were gathered both by standard research methods and special anthropological techniques. The degree of acceptance of the water system to innovation and change was found to be related to the position of the observer in the socio-cultural system and the relation of larger similar systems. Lack of articulation and planning between various elements of the larger socio-cultural system restricts full development of benefits. Full benefits in the total water resource development process were found to be dependent on seeking consumer values and actions as inputs in the process, thus calling for the added dimension of social accounting in all phases of water. (Murphy-Rutgers)

STRATEGIES FOR ENVIRONMENTAL MANAGEMENT,
Resources for the Future, Inc., Washington, D.C.
Allen V. Kneese.
Public Policy, Vol XIX, No 1, p 37-52, Winter 1971.

Descriptors: *Water pollution control, Resource allocation, Economic efficiency, Waste treatment, Water quality.
Identifiers: *Environmental management, Externality, Recycling, Subsidy, Effluent charge, Social cost, Regional management.

This article suggests that present environmental pollution problems are primarily the result of failures in the system of economic incentives. The example of residuals from production and consumption of resources is given to stress the need for an efficient approach to the management of congestion. The present federal subsidy-enforcement strategy toward water pollution control is criticized as ineffective and an alternative approach is outlined. This approach has two elements: the waste discharger must bear the costs of damage of his waste disposal activities through effluent charges; pollution problems should be handled through water quality management on a regional basis. The author suggests the effluent charge be on a national basis with regional agencies able to exceed the minimum, if necessary. It is hoped that federal leadership in the implementation of this proposal will lead to effective and efficient water quality management. (Siegenthaler-Rutgers)
W71-05935

WATER POLLUTION CONTROL, RIVER BASIN AUTHORITIES AND ECONOMIC INCENTIVES: SOME CURRENT POLICY ISSUES,
Bowdoin Coll., Brunswick, Maine; and Wisconsin Univ., Madison.
A. Myrick Freeman, and Robert H. Haveman.
Public Policy, Vol XIX, No 1, p 53-74, Winter 1971.

Descriptors: *Water pollution control, *Water quality, River basin commission, Resource allocation, Decision-making, Marginal cost, Economic evaluation, Municipal waste.
Identifiers: *Effluent charge, User charge, Subsidy.

This article examines policy alternatives to the current enforcement-subsidy approach to the improvement of water quality. These proposals emphasize comprehensive river basin planning and water quality management and stress economic incentives, prices and charges, as a means of reducing the output of industrial and municipal wastes. These proposals are used to illustrate the scope of the river basin authority, its powers and functions, the effects of Federal cost-sharing and the river basin authority as a political institution. The author then presents his own proposal for the reform of Federal policy through the establishment of a single experimental water basin authority based on the consolidations of existing agencies responsible for air, land, and water quality in a particular region. This authority would minimize reliance on legal enforcement and stress the use of economic incentives such as user and effluent charges. This approach would yield information on the effectiveness of the regional approach to environmental management and the ability of economic incentives to reduce waste generation at relatively low cost. (Siegenthaler-Rutgers)
W71-05937

OPTIMUM INVESTMENT IN WATER POLLUTION CONTROL,
Federal Water Pollution Control Administration, Arlington, Va.
Edwin L. Johnson.
In: Evaluation Processes in Water Resources Planning, Urbana, Illinois, American Water Resources Association, p 41-57, July 1970.

Descriptors: *Water pollution control, Optimization, Budget constraint, Cost-benefit analysis, Economic efficiency, Secondary treatment, Water quality, Systems analysis.
Identifiers: *Suboptimization, Objective function, Cost effectiveness.

This paper considers the operationalization of optimum investment in water pollution control. Current attempts at optimization result in suboptimization of costs because interrelations among air, water, and solid wastes are not treated. Investment is optimized subject to the secondary treatment and anti-degradation restrictions set by water quality standards. Within the context of water quality standards, the objective function tends to be characterized by constrained cost effectiveness. Recent research has questioned the basis upon which water quality plans are prepared and hence disturbed the predicted relation between pollution abatement and environmental quality. Inadequate implementation by institutions of plans for water pollution control is another obstruction to optimum investment. The author concludes that the major research areas for optimization are economic evaluation, reform of political and governmental institutions, development of means of measuring social preference and then introducing these into the systems analysis part of investment optimization. (Siegenthaler-Rutgers)

ECONOMIC ANALYSIS IN NATURAL RESOURCE PROGRAMS,
George Washington Univ., Washington, D.C.
Jack L. Knetsch.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 562-579, 1970.

Descriptors: *Economic analysis, *Natural resources, *Government, *Water resource development, *Cost benefit analysis, Flood control, Navigation, Irrigation, Budgets, Water supply, Pollution, Planning, Economic efficiency.
Identifiers: *Public expenditures, Resource allocation, Market incentives.

This article surveys several points pertinent to efforts to improve public expenditure decisions in natural resource programs, especially as related to relevant information and decision tools. Specific topics treated include the changing concerns of natural resource programs, and a sketch of how analytical guides for public expenditures resemble the market allocation of resources. Market incentives may be used increasingly to set priorities in public provision of resource services. The weakness of demand information is cited, along with the consequent effects on rationalizing expenditure

decisions. Finally, an outline is presented of some problems caused by the increasingly important values associated with natural resources largely beyond present quantification methods. A warning is given about the various viewpoints of the results of natural resource programs and an assessment of their efforts. The success of explicit cost-benefit analysis in the past in such areas as water development expenditures is acknowledged, along with the need for the extension of such methods in present applications and the need for greater flows of information to achieve desired investment and allocation guides in this (and others) natural resource areas. (Murphy-Rutgers)
W71-05940

ENVIRONMENTAL QUALITY MANAGEMENT,
Resources for the Future, Inc., Washington, D.C.
Blair T. Bower, and Walter Spoffard.
Natural Resources Journal, Vol 10, No 4, p 655-667, October 1970.

Descriptors: *Technology, *Water pollution, *Air pollution, *Environmental quality, Investment, Water supply, Reservoirs, Water treatment, Water courses, Agriculture, Irrigation, Pesticides, Streamflow, River basins, Effluents, Aeration.
Identifiers: *Material residuals, *Energy residuals, Receptors, Air filters.

This article focuses on those aspects of environmental quality affected by the material and energy residuals generated in man's activities and on those aspects of environmental quality directly affected by production and consumption activities where no residuals are involved. The residuals-environmental quality system is described as a composite of the economic-technologic-ecologic subsystem and the information-response-institution-management subsystem. The elements of the system are tied together by the three flows of material, energy and information. Both the material and energy residuals may be transported through, or deposited in or on, the three environmental media of air, water and land. Water is also discussed in its functions as a storage for residuals and as a receptor for ultimate residual concentrations, along with other elements of the natural environment. The article suggests that environmental quality may be maintained and/or improved through various methods of residuals management. Four measures suggested are the reduction of residuals generation, the modification of residuals after generation, better utilization of the assimilative capacity of the environment, and application of final protective measures. This article is germane to environmental quality management decision-making and particularly as it applies to the water resource area. (Murphy-Rutgers)
W71-05941

URBAN PLANNING ASPECTS OF WATER POLLUTION CONTROL,
Columbia Univ., New York.
Sigurd Grava.
New York, Columbia University Press, 223 p, 1969

Descriptors: *Water pollution, Watershed management, Waste disposal, Systems analysis, Treatment facilities, Decision making, Cost-benefit analysis, Resource allocation, Simulation.
Identifiers: *Urban planning, Collection network, Recycling

This book considers the various techniques and methods available in water pollution control and their role in community planning. The sources of pollution, treatment systems along with related financial and administrative considerations are discussed to provide background material in the planning for waste control. The author analyzes water pollution problems within the context of the entire watershed basin and formulates a model relating pollution control and waste management to local economic and ecological considerations. This analysis provides the basis for cost-benefit analysis of a particular watershed. The planning organization for watershed or community pollution control systems requires the formulation of objectives, translation of objectives to guidelines and standards, plan preparation and evaluation along with means of plan execution. The influence of population density and settlement patterns also affect waste management planning for communities. (Siegenthaler-Rutgers)
W71-05944

THE 'PROBLEM SHED' AS A UNIT FOR ENVIRONMENTAL CONTROL,
Resources for the Future, Inc., Washington, D.C.
Allen V. Kneese.
Archives of Environmental Health, Vol 16, No 1, p 124-127, January 1968.

Descriptors: *Water quality, Watershed, Decision-making, Economies of scale, Resource allocation, Economic efficiency, Effluent charge, Systems analysis.
Identifiers: *Problem shed, Externality, Indivisibility, Market failure, Decreasing costs, Environmental control.

This paper considers the role of externalities and indivisibilities in the selection of a problem shed as a unit of environmental planning and control. An example is given of industrial waste discharges that impose external costs on downstream municipal water treatment facilities. Economic efficiency requires that an administrative agency or problem shed be formed to reduce the waste discharge through the imposition of an effluent charge on the waste discharger. The problem shed should be of appropriate size in order to internalize externalities and efficiently manage environmental problems by large scale regional measures. The problem shed is used in research on water quality management but the opposition of local jurisdictions has retarded the implementation of this concept as an administrative agency. (Siegenthaler-Rutgers)

REGIONAL PLANNING,
North Carolina Univ., Chapel Hill.
Maynard Hufschmidt.
New York, Praeger, 1969. 396 p.

Descriptors: *Planning, Cost-benefit analysis, Decision making, Resource allocation, Flood control.
Identifiers: *Regional planning, Objective function, Environmental planning, Economic growth.

This book considers the relationship between regional planning and associated planning fields. The topics considered are regional planning as a field, environmental planning, natural resources planning, planning for community and human resources and planning for economic development. The papers included stress both the theoretical and practical aspects of planning and decision making. The economic context as well as the political institutional context is stressed in plan implementation. The limitations of cost-benefit analysis are noted and the need for broader socioeconomic objectives is mentioned. The discussion of cost benefit analysis and environmental planning make this book relevant to applied water studies. (See also W71-05950) (Siegenthaler-Rutgers)

Descriptors: *Water resource planning, Water pollution, Air pollution, Flood control, Economic value, Economic evaluation, Cost-benefit analysis, Design criteria.
Identifiers: *Investment decision, Objective function, Matrix.

This essay examines the present scope of environmental planning and identifies some unique aspects of environmental planning within the framework of the investment decision model. The author finds environmental planning similar to water resource planning in the 1930's and to the multipurpose nature of present water resource development. The objectives of individual programs for environmental planning are prevention of sickness, aesthetic stimulation of the senses, and economic value. However, these objectives serve as constraints in an investment decision model. The author also discusses the difficulty of relating the objectives of environmental planning such as economic growth to design criteria and science. The applicability of utility theory, stimulation, and political decision-making is considered for environmental planning. (See also W71-05949) (Siegenthaler-Rutgers)

INFORMATION FOR DECISION MAKING,
Northwestern Univ., Evanston, Ill.
Alfred Rappaport.
Englewood Cliffs, Prentice-Hall, Inc., 447 p, 1970.

Descriptors: *Decision making, Risk, Linear programming, Cost, Regression analysis.
Identifiers: *Capital budgeting, Information technology.

This book contains a series of essays that relate advances in the management sciences and behavioral sciences to the task of effectively designing and using decision-oriented information systems. The role of models in decision-oriented information systems is outlined with problems of implementation and extensions discussed. Methods of dealing with uncertainty of planning and control variables are discussed with several applications given in capital budgeting and linear programming. The impact of information on decisions and performance is considered. The central theme of this book centers on the issues of decision making and accordingly, this is relevant material for water investment studies. (See also W71-05954 and W71-05955) (Siegenthaler-Rutgers)
W71-05953

UNCERTAINTY AND ITS EFFECT ON CAPITAL INVESTMENT ANALYSIS,
Kentucky Univ., Lexington.
Martin B. Solomon.
In: Information for Decision Making, Englewood Cliffs, Prentice-Hall, p 278-283, 1970.

Descriptors: *Project feasibility, Risk, Economic evaluation, Interest rate, Cost, Discount rate.
Identifiers: *Capital budgeting, Sensitivity analysis, Payback period, Present value, Estimation error.

One aspect of capital budgeting is considered, namely, the application of theoretically correct criteria such as present value and discounted rate of return to actual investment decisions. The author contends that these theoretically correct choice criteria have limited practical value when uncertainty is present with respect to cost, revenues and project life. To illustrate this contention, investments with constant annual returns and those with declining annual returns are considered. The results of the sensitivity analysis indicate that relatively small overestimates and underestimates create large errors in the discounted rate of return. For investment decisions characterized by a large amount of uncertainty, the payback criterion can provide results superior to the present value and discounted rate of return methods for project evaluation. This article is relevant to water resources studies concerned with capital budgeting and decision making. (See also W71-05953) (Siegenthaler-Rutgers)

W71-05954

SENSITIVITY ANALYSIS IN DECISION MAKING,
Northwestern Univ., Evanston, Ill.
Alfred Rappaport.
In: Information for Decision Making, Englewood Cliffs, Prentice-Hall, p 174-190, 1970.

Descriptors: *Decision making, Risk, Resource allocation, Linear programming, Operations research, Optimization.
Identifiers: *Sensitivity analysis, Objective function, Information decision, Decision theory.

The applicability of sensitivity analysis to decision making under risk is considered. Sensitivity analysis tests the responsiveness of model results to changes in parameter values and offers information for appraising the relative risk among alternative courses of action. This method is applicable to operating decisions and provides guidelines for allocating organizational resources to data collection activities as well. Applications of sensitivity analysis to both operating and information decisions are presented. The author uses a linear programming model to illustrate the risk analysis and information economics applications of sensitivity analysis. The relationship between sensitivity analysis and the statistical decision theory approach to information decisions is outlined. This essay is relevant to water studies concerned with the role of uncertainty in project evaluation. (See also W71-05953) (Siegenthaler-Rutgers)

MEASURING EFFICIENCY IN GOVERNMENT SERVICES,
York Univ. (England).
J. P. Hutton.
In: Quantitative Analysis in Public Finance, New York, Praeger Publishers, p 91-109, 1969.

Descriptors: *Economic efficiency, *Government, *Resource allocation, *Cost-benefit analysis, Sewage, Social aspects, Management, Transportation, Technology.
Identifiers: *Productivity, *Input-output analysis, Growth, Employment, Stability, Price, Scarcity.

This paper discusses various aspects of the measurement of efficiency in government services, indicating the problems associated with measuring the aggregate productivity despite the accepted infrastructure of roads, sewage and water, police, and the like. The process of measuring such productivity is likened to retrospective cost benefit analysis. The notions of efficiency under various titles such as price, technical, overall, and managerial efficiency are dealt with in their relation to decision-making in resource or service areas. Some techniques of analysis are surveyed in both state and local government contexts, citing the particular difficulties of measuring quality in productivity. Various resources are used as examples of what to expect in an optimal resource allocation situation. The problems of administration and data are also discussed, following which G. Hauser comments on the entire efficiency problem. This article is particularly relevant to issues in allocation difficulties and is consequently valuable to water resource researchers. (Murphy-Rutgers)

THE ROLE OF INCENTIVES, PENALTIES, AND REWARDS IN ATTAINING EFFECTIVE POLICY,
Brookings Institution, Washington, D.C.
Charles L. Schultze.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 145-172, 1970.

Descriptors: *Decision making, *Water pollution, Natural resource allocation, *Government, Investment, Budgets, Flood control, Waste treatment, Dams, Sewers, Effluents, Taxes.
Identifiers: *Incentives, *Public expenditure policy, Program design, Program execution.

The problem of incentives in the formulation of public expenditure policy is surveyed. This problem arises because such decision-making results from the joint action of many independent decision-makers, and the fact that public programs are increasing rapidly in both scope and complexity, embracing such matters as urban rehabilitation, air and water pollution control, and development of depressed areas. The problem of incentives is regarded as an aspect of social behavior to be considered at every stage of public policy formulation, including formation of objectives, program design and resource allocation. The various types of incentives which appear relevant in such policy formulation are treated and include incentives which result in rechanneling actions towards greater efficiency. Finally, some of the theoretical and political problems which arrive in applying incentive concepts to public expenditure programs are discussed. This article is relevant to those interested in the maximization of federal investment programs involving resource allocation. (Murphy-Rutgers)
W71-05959

INSTITUTIONAL OBSTACLES TO REALLOCATING GOVERNMENT EXPENDITURES,
Washington Univ., St. Louis, Mo.
Murray L. Weidenbaum.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 232-245, 1970.

Descriptors: *Cost-benefit analysis, *Government, *Welfare economics, *Resource allocation, Social aspects, Budgets, Taxes, Investment, Financing, Decisionmaking.
Identifiers: *Institutional obstacles, Fixed charges, Controllability, Social insurance, Policy decisions.

This article considers the major obstacles to making improvements in allocating public resources operational, with special attention to those constraints that limit the discretion of governmental policymakers. This goal is achieved through a study of the techniques of governmental budgeting which highlights the substantive issues involved in the allocation of government resources. The basic explanation is presented in terms of the differences in the relative controllability, the appropriations review process, and the different types of government spending programs. Among the changes proposed to reduce institutional obstacles to effective resource allocation are a review of the necessity for numerous established trust funds, a reevaluation of the need for various permanent and indefinite appropriations, a reexamination of the 'fixed charges' on the budget, and a greater focus on the new starts of construction and other long term projects. The content of this article holds particular interest to those concerned with the allocative efficiency of government water resource investment. (Murphy-Rutgers)
W71-05961

PROJECT DESIGN AND EVALUATION WITH MULTIPLE OBJECTIVES,
Bowdoin Coll., Brunswick, Maine.
A. Myrick Freeman, III.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 347-363, 1970.

Descriptors: *Decision-making, *Cost-benefit analysis, *Economic efficiency, Flood control, Transportation, Spillover, Wastes, Municipal water, Income.
Identifiers: *Multiple objectives, *Public expenditures, *Weighting functions, Externalities, Valuation techniques, Constraints.

The problem of allocating limited government budgets among competing programs is surveyed. The problem is basically one of valuation; namely, assigning meaningful prices to all benefits. It is also indicated that choice among different kinds of benefits is unavoidable in the (either/or) allocation procedure under discussion and that a one-to-one relationship exists between the choices and relative values for different benefits. When values are not generated by market behavior, it is suggested that values be considered in the form of explicit weighting or social welfare functions for decision-making purposes, although such weighting functions cannot be inferred from observed choices among public expenditure programs. It is proposed that such functions should be based on consideration of legislative intent, guidelines in law and precedent, and subjective evaluations by politically responsive decision-makers. All these procedures are most likely to be successful if the initiative comes from executive agencies and is used in areas of established programs and repeated decisions. These criteria make the proposed design and evaluation methods of benefit estimation especially relevant to the water area. (Murphy-Rutgers)
W71-05962

THE ABSENCE OF KNOWLEDGE OF DISTRIBUTIONAL IMPACTS: AN OBSTACLE TO EFFECTIVE POLICY ANALYSIS AND DECISIONS,
Michigan State Univ., East Lansing.
James T. Bonren.
In: Public Expenditures and Policy Analysis Chicago, Markham Publishing Company, p 246-270, 1970.

Descriptors: *Water resource development, *Government, *Cost-benefit analysis, Capital costs, Investment, Decision-making, Social aspects, Taxes, Income, Irrigation, Statistics.
Identifiers: *Distributional impacts, *Public programs, *Higher education, *Farm program.

The distributional consequences of public decisions have major and increasingly important impacts in our society. Little is known about the distributional impacts of public programs, the social processes by which such impacts are institutionalized, or how to redesign distributional systems without incurring excessive political or social costs. It is proposed that increased efforts to obtain data for program analysis of the distributional impacts of public decisions is prerequisite to the desired efficiency of such decision-making and the integrity of public commitments in equity. Examples of education, water resource development, and the farm program are utilized in indicating the many unintended consequences which may result from public decisions in which no data had been systematically collected on distributional impacts. Working from the objectives given in the article, past decisions in the three areas cited are pointed out as lacking in economic and social wisdom. (Murphy-Rutgers)
W71-05963

EXTERNALITIES, INFORMATION AND ALTERNATIVE COLLECTIVE ACTION,
Northwestern Univ., Evanston, Ill.; and Carnegie-Mellon Univ., Pittsburgh, Pa.
Otto Davis, and Morton Kamien.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 74-95, 1970.

Descriptors: *Cost-benefit analysis, *Technology, *Optimization, Natural resource development, Water pollution, Sewage, Capital, Costs, Fishing, Government, Taxes, Social aspects.
Identifiers: *Externalities, *Pareto optimality, Collective action, Welfare economics, Information.

This article amplifies the major conclusion of modern welfare economics which can be viewed as a theorem concerning the allocation of resources by a market mechanism. Particular attention is given to the basic assumptions underlying this theorem. The criterion, the market and optimality are discussed as are problems associated with externalities. Various possible solutions are discussed

in terms of their potential effectiveness. Some of these are solutions by prohibition, directive, voluntary action, taxes and subsidies, regulation, payment, or action. These are all presented to deal with problems of technological externalities. It is proposed that the tools of cost benefit analysis provide the proper perspective for a policymaker attempting to attain an acceptable allocation of limited resources, such as water. (Murphy-Rutgers)

THE TREATMENT OF RISK AND UNCERTAINTY,
California Univ., Los Angeles.
Jack Hirsbleifer, and David Shapiro.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 291-313, 1970.

Descriptors: *Risk, *Uncertainty, *Cost-benefit analysis, Economic efficiency, Income, Investment, Government, Technology, Decision-making, Costs, Social aspects, Prices, Taxes, Pooling.
Identifiers: *Certainty-equivalent value, *Time-state preference, Externalities, Expected value, Risk aversion, Time preference, Market equilibrium.

Risk and uncertainty in the analysis of public investment decisions is considered. The analysis is discussed within the framework of cost-benefit principles, the efficiency criterion and dollar values reduction. Risk is considered as a suggestion of the potential variability of the objective configuration of events, while uncertainty labels the subjective lack of knowledge about the configuration results. Risk is considered both as a concept of expected value and as a concept of the certainty-equivalence value of an uncertain outcome in government decision making. A riskless case is presented, and a review is made of risk-aversion literature on cost-benefit analysis for public investment decisions. Past and present government practices are surveyed to indicate the wide variety of decision rationales. The model of time-state preference is shown as a theoretical advance in the direction of an exact theory of risk, leading to the present certainty-equivalent value criterion as a generalization of present value criterion applicable. This article should be of use as a review and extension of the analysis of risk and uncertainty for water resource investment decision-making. (Murphy-Rutgers)

RESCUING POLICY ANALYSIS FROM PPBS,
California Univ., Berkeley.
Aaron Wildavsky.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 461-481, 1970.

Descriptors: *Cost-benefit analysis, *Decision-making, *Planning, *Budgeting, Government, Risk, Health, Economic efficiency, Income.
Identifiers: *Policy analysis, *PPBS, Incentives, Inertia, Creativity, Defense.

Aspects of providing the information which contributes to politically and socially relevant decision-making are considered. This is achieved through evaluation of alternative means and ends in pursuit of suitable policy recommendations and through the sustained application of intelligence and knowledge to social problems. This article proposes that the traditional planning-programming-budgeting system has brought great damage to effective policy analysis, citing the special difficulties of inertia, personnel and the lack of trained personnel. In order that policy analysis prospers, the author suggests that top management must desire such analysis and the incentives must be increased for the suppliers of such analysis. The need for reexamination of critical aspects of policy analysis is indicated, citing the example of water resource projects. This article is relevant to those involved in water resources policy analysis. (Murphy-Rutgers)

INSTITUTIONAL FACTORS INFLUENCING WATER DEVELOPMENT IN TEXAS,
Texas A and M Univ., College Station. Water Resources Inst.
Warren L. Trock.
Available from NTIS as PB-198 090, $3.00 in paper copy, $0.95 in microfiche. Research Project Technical Report No TR-35, March 1971, 35 p, 6 tab, 37 ref. OWRR Project B-025 TEX (7).

Descriptors: *Institutions, *Planning, Irrigation, *Water rights, *Irrigation districts, *Interbasin transfers, Cost sharing, Water law, Water administration, *Districts, *Texas.

Attention has been given to institutions which are important to (1) the implementation of the Texas Water Plan, and (2) the efficient use of water resources in irrigation in the lower Rio Grande Valley. Numerous political and economic institutions must be changed or newly developed to provide for (1) the interbasin diversions proposed by the Texas Water Plan, (2) the creation and management of transfer systems and (3) distribution of water within importing areas and fulfillment of financial obligations. These will be expressed by individuals and groups various points of view relative to water developments and the administration of water supplies. Self interests will be forcefully expressed. Competing users of water will make themselves heard. Institutional arrangements to resolve conflicts, to provide for development of water systems and to insure efficient use of water will be critical to the success of the Plan. Institutions of particular importance to efficient distribution and use of water in irrigation in the lower Rio Grande Valley are the irrigation districts and their policies and operations plus water rights. While operations of districts could significantly be influenced by consolidation of districts, rehabilitation, and changed managerial policies, there are important barriers to such change. Present low costs of water in districts and the desire to maintain control of irrigation systems policies and procedures in local districts may not allow change to take place. Negotiable water rights are a possibility, and exchange of rights or annual allocations would improve efficiency of water use. District members need to be made aware of consequences of such a change in this institution. An informational program relative to water management would be helpful.

Much of a 4-county semi-arid rural area of southeastern Nebraska suffers from limited ground and surface waters, and from highly mineralized groundwater. Pawnee, Johnson, Richardson and Nemaha Counties have been economically damaged as water restricts town, farm and ranch growth. Rural water districts (RWD) may be the solution to this problem. RWD, similar to rural electric districts, will provide water to subscribers, as authorized by the legislature as LB 896 in 19
Preliminary work divides Nemaha County into
water districts which may operate economica
Four more RWDs are being developed. Surveys

This report is a review draft of chapter 6 which is a part of one of three stages of the overall North Carolina Water Plan. Included in this review are National Assessment of Water Resources Research Needs; Water resources Problems and Research Needs in North Carolina; Water Resources Research in North Carolina Supported by Federal Agencies; Water Resources Research in North Carolina Performed by Federal Agencies; Private Industry Research in North Carolina; State Government Operating Agency Research in North Carolina; Non-Profit Institute Water Research in North Carolina; Water Resources Research Institute; Institute of Government of the University of North Carolina; Office of Marine Sciences; and University Community at Large. A bibliography of published reports of the North Carolina Water Resources Research Institute is included. (Woodard-USGS)
W71-06116

SAFE YIELD OF AQUIFERS: AN ECONOMIC REFORMULATION,
Resources for the Future, Inc., Washington, D.C.
Robert A. Young.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, NoIR 4, p 377-385, December 1970. 9 p, 24 ref.

Descriptors: *Safe yield, *Cost-benefit analysis, *Optimization, Water conservation, Groundwater, Water resources development, Water yield, Water yield improvement, Pumping, Aquifers.
Identifiers: Groundwater resources.

Concepts of safe yield of groundwater reservoirs have been criticized by hydrologists as ambiguous, pseudohydrologic and overly limited in scope. From the perspective of economics, these difficulties stem from application of an essentially descriptive (factual) concept to the prescriptive (normative) problem of resource allocation. From the theory of optimal resource allocation in economics, it is shown that groundwater basin management becomes an issue of public concern because of the existence of technical conditions which prevent the market mechanism from properly functioning in the allocation of groundwater. The rules for allocating groundwater implicit in the prescriptive definition of safe yield are addressed to significant issues, problems which are termed external diseconomies in economics. However, these rules are deficient in that they focus on costs of groundwater withdrawals while ignoring associated benefits. The objective of maximizing net economic yield (the present value of social benefit minus social costs) is suggested as an alternative to safe yield criteria for groundwater basin management. SUSQUEHANNA RIVER BASIN STUDY (SUMMARY),
W. J. Love.
Susquehanna River Basin Study Coordinating Committee Report, June 1970. 155 p, 56 fig, 27 tab.

Descriptors: *River basin commissions, *Investigations, *Water Resources Planning Act, *River basin development, *Planning, Watershed management, Multiple-purpose projects, Evaluation, Economic impact, Appraisals, Data collections, Environmental effects, Acid mine water, Water pollution control, Water requirements.
Identifiers: *Susquehanna River basin, Coordinating committee report, Long-range Framework Plan.

An illustrated summarization is given of a 6-yr study of the Susquehanna River Basin, begun in 1963 by a coordinating committee of representatives from the Department of Agriculture; Army; Commerce; Health, Education and Welfare; Housing and Urban Development; and the Interior; the Federal Power Commission; the States of New York, Maryland, and Pennsylvania. The collection and analysis of data and the formulation of a plan for achieving the stated objectives are described. The objectives were to evaluate the water resources potential of the Basin, determine water needs of the increasing population, analyze alternative solutions, recommend programs necessary to manage the water resources to meet the economic and social needs of the people, and to preserve the Basin's high natural values for present and future generations. The Susquehanna drains a 27,500 sq mi area, 6,300 in New York, 20,900 in Pennsylvania, and 300 in Maryland. The river flows through intensively developed industrial areas, farm lands, and large forests with an average discharge of 25 bgd. Flow rate varies widely, from a low of 1 bgd in September 1932 to a high of 536 bgd (830,000 cu sec) in the March 1936 flood. The health and well being of the Chesapeake Bay above the mouth of the Potomac River is dependent upon the Susquehanna, which furnishes 85% of the fresh water that enters the Bay. (Lang-USGS)

YORK RIVER BASIN COMPREHENSIVE WATER RESOURCES PLAN-VOLUME 1, INTRODUCTION.
Virginia Dept. of Conservation and Economic Development, Richmond. Div. of Water Resources.

Virginia Division of Water Resources Planning Bulletin 225, Ocotober 1970. 112 p, 21 plate, 13 tab, 21 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Virginia, Watersheds (Basins), Evaluation, Hydrologic data, Climatology, Meteorology, Hydrology, Geology, Economics, Waste water (Pollution), Recreation, Agriculture, Irrigation, Impoundments, Industries, Streams, Water resources development, Planning, Navigation, Water quality.
Identifiers: *York River basin (Virginia).

The York River basin, located in the central and eastern section of Virginia, has an estimated population of 117,000 in an area of 2,661 square miles. The basin is re-examined in light of its latest growth, to project the economy of the area to the year 2020 and to determine the quantitative and qualitative water needs of the area for the future as well as for the present. The reports of the study will be contained in six volumes. This report, Volume 1, is designed to acquaint the reader with the York River basin and to present factual data relevant to the basin. The history and the natural and economic characteristics of the major political subdivisions of the basin are outlined. Other subjects discussed are the basin's water development history, existing power supply, navigation geology, mineral resources, groundwater, municipal and industrial water supply, agriculture and recreation. Drainage area data for the major rivers in the basin and their tributaries are tabulated. (Woodard-USGS)
W71-06230

YORK RIVER BASIN COMPREHENSIVE WATER RESOURCES PLAN, VOLUME III-HYDROLOGIC ANALYSIS,
Virginia Dept. of Conservation and Economic Development, Richmond. Div. of Water Resources.

Virginia Division of Water Resources Planning Bulletin, November 1970. 130 p, 56 plate, 18 tab, 16 ref.

Descriptors: *Water resources development, *Virginia, *Surface waters, *Groundwater, *Hydrologic data, Data collections, Planning, Meteorological data, Rainfall-runoff relationships, Streamflow, Flow rates, Low flow, Peak discharge, Flood forecasting, Aquifers, Aquifer characteristics, Water wells, Water quality, Chemical analysis, Hydrology, Geology.
Identifiers: *York River Basin (Virginia).

The Comprehensive York River Basin Water Resources Plan in Virginia will be contained in six volumes. This report (Vol. 3) presents data and discussions of surface-water runoff, groundwater supply, climate and meteorology. Tables and plates illustrate the mean and the extremes of precipitation, temperature and other climatological data. A brief resume of this data and the history of weather conditions are included. The program for collection of surface-water runoff data is given with an explanation of how the data may be used. Curves are developed through various analytical methods to determine the probable return period in years for specified low flow intervals; an analysis is made of flow duration to determine the percent of time a specified flow will be equaled or exceeded; and curves are developed to determine the frequency of floods on a regional basis. The lithology and hydrology of geologic aquifers are discussed and related to potential groundwater availability. Data on groundwater wells are analyzed; the quality of groundwater is summarized; and plates and tables illustrate the groundwater potential for planning pruposes. (See also W71-06230) (Woodard-USGS)

A CRAZY IDEA ON URBAN WATER MANAGEMENT,
Pennsylvania State Univ., Unversity Park. Dept. of Civil Engineering.
Sie Ling Chiang.
Water Resources Bulletin, Vol 7, No 1, p 171-174, February 1971. 2 fig.

Descriptors: *Water resources, *Water management (Applied), *Cities, *Storm runoff, Hydrology, Flood control, Groundwater recharge.
Identifiers: *Metropolitan water resources management, *Urban water management, *Rooftop storage, Urban hydrology.

High percentage of imperviousness in the city is the source of storm runoff. Roof area contributes significantly to the imperviousness. An attempt to

make use of roofs as urban flood control device and water conservation measure is advocated. Two different schemes, one for built-up industrial-commercial area, the other for residential area, are suggested. The former utilizes the roof as detention reservoir for flood control, the latter employs recharge pit to convert runoff into groundwater resource. The proposed schemes are not only hydrologically, hydraulically and structurally sound but also economically feasible. It is worth considering in the future planning of urban renewal and urban development. (Davis-Chicago)
W71-06309

LAND USE FUNCTION IN WATER QUALITY MANAGEMENT,
North Carolina Water Resources Research Inst., Raleigh.
David H. Howells.
Water Resources Bulletin, Vol 7, No 1, p 162-170, February 1971. 17 ref.

Descriptors: *Land use, *Water quality, *Water quality control, Water policy, Land management, Water pollution control, Standards, Regulation, Runoff.
Identifiers: *Water quality management, *Land use policy, Land use control.

The Nation has entered a new era of water quality management in which land use policy and regulation must assume an increasingly important role. The benefits of tertiary and advanced waste treatment may be offset by contradictory land use and pollution from land runoff. Unless land use planning and controls are included in water quality management, land-imposed constraints on water quality can be anticipated. Pollution from major types of land runoff are reviewed with respect to sources, effects, and control procedures. Emphasis is given to land use practices and controls. The crucial issue with regard to the latter is lack of land use policies at federal, state, and local levels. State legislation establishing guidelines and minimum standards for land use regulation by local government is required. The dependency of water quality on land use points to the fallacy of attempting to provide for comprehensive water pollution control outside the context of comprehensive land-water resources planning and management. (Davis-Chicago)

Water Resources Bulletin, Vol 7, No 1, p 79-92, February 1971. 4 fig, 2 tab, 7 ref.

Descriptors: *Water supply, *Cities, *Costs, Networks, Network design, Pipelines, Interbasin transfers, Urbanization, Pumping plants, Design.
Identifiers: *Water supply systems, *Economic design, Conveyance cost.

Adequate and good quality water supply for medium sized towns is costly when there are insufficient quantity and low quality of groundwater or surface water. In a central water supply system serving a number of towns, the economics of scale may permit a sufficient and good quality supply at lesser rates. Such a system has the flexibility of supplying rural population through small service lines. The system may be an interbasin or intrabasin conveyance depending on the location of a suitable water source and the economics of the supply network. Seven cost elements are pertinent to the optimum or least-cost design of network consisting of pipelines and pumping stations. The relevant cost functions are based on the available data gathered from various sources. Water conveyance costs are calculated for various flow rates, pipeline diameter, flow variabilities, static heads, and interest rate, thus providing a measure of sensitivity of the conveyance cost to such variations. The economics of scale, the sensitivity of optimum unit conveyance costs, and variations in unit costs with change in cost functions are useful in making a feasibility study for a proposed conveyance system. MEASURING INTANGIBLE BENEFITS--SOME NEEDED RESEARCH,
Massachusetts Univ., Amherst. Dept. of Agricultural and Food Economics.
J. B. Wyckoff.
Water Resources Bulletin, Vol 7, No 1, p 11-16, February 1971. 19 ref.

Descriptors: *Methodology, *Research and development, *Intangible benefits, Cost-benefit analysis, Costs, Benefits, Aesthetics, Measurement, Analytic techniques.
Identifiers: *Water project analysis, Multiple objective functions, Tradeoff models.

Society has long sought to maximize the welfare of its members by allocating its limited resources so as to provide maximum satisfaction. As long as all of the values that society gains or loses are measured in the market place in terms of price, the process of maximizing through economic models is relatively straightforward. However, the total value that society receives from the use of its resources is not completely measured through the private market transactions. There are some values created which are external to the market system. The resulting underinvestment in natural resources by the private sector necessitates the entry of the public sector. The presence of intangible benefits and intangible costs has long been recognized, but completely satisfactory methods for including these in the quantitative analysis of benefit-cost have not been developed. Some progress has been made in including recreational values in project analysis via the expenditures method, the Gross National Product method, consumer surplus method, cost method, market value method, and monopoly and discriminating monopoly methods, but little has been done in the area of aesthetic values. Techniques for including such values in project analysis need to be further researched. Tradeoff models developed by market researchers, the advertising industry, social psychologists and sociologists may have some applicability. Moethodology for including proposed multiple objective functions in project analysis is also a critical need. (Davis-Chicago)

WATER RESOURCES MANAGEMENT IN THE PUBLIC INTEREST,
New York State Dept. of Environmental Conservation, Albany.
Terence P. Curran.
Water Resources Bulletin, Vol 7, No 1, p 33-39, February 1971. 18 ref.

Descriptors: *Water resources development, *Planning, *Social aspects, *Decision making, Political aspects, Social values, Ethics.
Identifiers: *Water resources management, *Public interest, Public participation, Planning objectives, Political ethics, Interest groups.

The water resources manager, concerned with providing for citizen needs in all its varied aspects, is obliged to consider the public interest in his decision making. But the public interest, although inferring the superiority of public over purely private interests, is more of a concept of political ethics than an operational objective. Recent attacks on water resources developments place in question just how responsive the water resources manager has been to the public at large during the planning process. The recent broadening of planning objectives beyond economic efficiency to include greater attention to social goals is an encouraging development. Efforts should be expanded toward greater citizen participation and more attention should be given to sampling surveys to determine citizen attitudes on water resources proposals. In the last analysis, the decision-making process must com bine the expertise of the water resources manage and the participation of the people through th political process. (Davis-Chicago)

PUBLIC PARTICIPATION IN WATE PLANNING: A CRITIQUE OF THEORY, DOC TRINE, AND PRACTICE,
Colorado State Univ., Fort Collins. Dept. of Polit cal Science.
Norman Wengert.
Water Resources Bulletin, Vol 7, No 1, p 26-3 February 1971. 1 fig, 14 ref.

Descriptors: *Water resources developmen *Planning, *Methodology, *Decision makin Political aspects, Political constraints, Institutions Identifiers: *Public participation.

Water development planning has virtually since i beginnings over one hundred fifty years ago utilize a variety of devices for involving segments of th public. But a new insistence for increased publi participation, particularly at the Federal level, ha stimulated re-examination of objectives an methods for relating water planning to citizen in terests and preferences. Involved is partly a recon mitment to democratic symbols, partly a recogn tion that segments of society have been ove looked, and partly a reaction to the pressures c confrontation and demonstration. The rhetoric an polemics of participation have often impled a kin of 'town-meeting' process of decision, difficult a best in a nation of 200 million. In water plannin more emphasis has been placed on listening t citizens, which has meant providing opportunitie for influentials to express their views an preferences. A more adequate approach woul seem to require identification of all who are signif cantly affected by plans and proposals (eve though they may not perceive their interest). Bu gaining greater participation does not make th planning job easier. It may increase tension an conflict; it may require difficult choices; and it ca later existing power relationships and generat changes with considerable consequences for th agency and its programs. IMPROVING WATER RESOURCE ALLOCA TION THROUGH DEMAND-ORIENTE WATER POLICY,
Texas A and I Univ., Kingsville. Dept. c Economics.
Ronald D. Finster.
Water Resources Bulletin, Vol 7, No 1, p 17-2 February 1971. 1 tab, 4 ref.

Descriptors: *Water allocation (Policy), *Wate policy, *Water supply, *Water demand Economics, Regions, Regional analysis, Arizona Resource allocation, Inter-basin transfers, Ari lands.
Identifiers: *Demand-oriented water policy.

In the arid and semi-arid regions of the Wester United States the water problem is generally pe ceived as one of 'inadequate' supply. This concep tion of the problem engenders supply-oriente water policy, or policy focusing exclusively upon single class of solutions - the various schemes fo augmenting an area's water supply. In a mor complete or balanced conceptualization, the wate problem is viewed as one of 'inadequate' suppl and/or 'excessive' demand. When the wate problem is so conceived, water policy is broadene to include demand-oriented water policy, or polic aimed at reducing the quantity of water demande in an area. The purpose of this paper is to describ and explain demand-oriented water policy. Bas cally it consists of changing the set of commoditie produced by the economy, cutting back and/o eliminating goods requiring large quantities c water in their production and introducing and/o expanding goods which require little water. Thi paper also reports briefly on research undertake

est demand-oriented policy in Arizona. Results icate that such a policy can be extremely effica- us in solving a region's water problem. (Davis- icago)

CRITICAL SURVEY OF USE OF COST-EFIT ANALYSIS IN PUBLIC FINANCE,
n Univ. (Italy).
no Contini.
Quantitative Analysis in Public Finance New k, Praeger Publishers, p 65-89, 1969.

criptors: *Cost-benefit analysis, *Irrigation, onomic efficiency, *Flood control, *Model stu- *Forecasting, *Water treatment, Investment, ulation, Weather, Marginal costs, Technology, es, Costs, Recreation.
tifiers: Partial equilibrium analysis, Income stribution, Externalities, Consumer surplus, ortunity costs, Health programs.

article discusses the basic uses of cost-benefit ysis in public finance. An analogy of a horse rabbit stew is used to juxtapose the con- ences that can be measured and evaluated nu- cally with an amalgam of external effects, so- emotional and psychological impacts, and rical and aesthetic considerations. It is as- ed that the use of cost-benefit analysis is ed to use as a tool of partial equilibrium analy- ince the technique of such decision-making be utilized within a framework that has been led upon in advance. The need for cost-benefit ysis to handle both allocation and redistribu- effects is considered in detail. Valuation of fits is discussed using many examples in the r and natural resource areas. Timing difficul- re also analyzed, using certain applications in ontext of water resource development. Costs hen similarly analyzed. Intangible effects of benefit analysis are also discussed with par- ar attention to problems of recreation, flood ol systems, education, and health programs. article provides a background discussion for benefit decision-making in the water resource (See also W71-05947) (Murphy-Rutgers)

FISCAL ECONOMIST AND QUANTITA- ANALYSIS,
Univ. (England).
T. Peacock.
uantitative Analysis in Public Finance, New Praeger Publishers, p 3-11, 1969.

iptors: *Cost-benefit analysis, *Economic ef- cy, *Government, Decision-making, ource development, Budgets, Optimization, l aspects, Statistics, Environment.
fiers: *Econometric techniques, Productivity sis, Quantitative analysis, *Preferences, ource growth, Inflation, Public goods.

rticle briefly summarizes several studies on itative analysis and relates their content to rious stages of the process of formulating and ting policies through the system of public e. The use of cost benefit analysis as a means ject appraisal in the resource area is studied t of the ultimate goal of efficiency. Particular attention is given to several aspects of this problem. Articulation of preferences is discussed as being typical of the recent development of nonmarket economics which utilizes economic concepts in analyzing community choices and their effects on public policy. Various hypotheses about government sector growth are presented as they relate to these consumer preferences. Extensive treatment of cost-benefit and efficiency analysis is presented, both from the viewpoint of mathematical constructs and statistics and from the viewpoint of correct specification of the economics underlying such appraisals. This article is relevant to water studies in presenting the recent extension of economic analysis to non-market phenomena in the public finance area. (Murphy-Rutgers)

COLLECTIVE ACTION AND THE DISTRIBUTION OF INCOME: A CONCEPTUAL APPROACH,
Wisconsin Univ., Madison.
Burton A. Weisbrod.
In: Public Expenditures and Policy Analysis Chicago, Markham Publishing Company, p 117-141, 1970.

Descriptors: *Income, *Government, *Cost-benefit analysis, *Economic efficiency, Taxes, Flood control, Economic evaluation, Government supports, Welfare economics.
Identifiers: *Resource allocation, *Economic stabilization, *Allocative efficiency, Income transfers, Criteria, Public policy, Poverty.

The income redistribution function of the federal government is considered as interrelated with the other government functions of allocative efficiency and economic stabilization. Topics treated include the ways by which government activities affect the distribution of income in the society, types of redistributional programs, criteria for judging such programs, and conflicts among the various criteria. Direct redistributive activities such as welfare payments are compared with indirect activities which also serve to redistribute income, such as tax policies. The direct and indirect consequences of economic stabilization policies and resource allocation policies on the distribution of income are also considered at some length, using the examples of education and flood-control policy. Six criteria by which such widespread effects of government on income distribution are then surveyed and various advantages and disadvantages of each are presented. The article is particularly useful in the cost-benefit analysis of income distribution effects resulting from water resource investments. (Murphy-Rutgers)
W71-05960

THE ORGANIZATION OF ECONOMIC ACTIVITY: ISSUES PERTINENT TO THE CHOICE OF MARKET VERSUS NONMARKET ALLOCATION,
Harvard Univ., Cambridge, Mass.
Kenneth J. Arrow.
In: Public Expenditures and Policy Analysis, Chicago, Markham Publishing Company, p 59-73, 1970.

Descriptors: *Natural resource allocation, *Cost benefit analysis, *Costs, Economic evaluation, Taxes, Government, Economic efficiency, Optimization, Risks.
Identifiers: *Externalities, *Competitive equilibrium, *Transaction costs, *Market failure, Collective action.

Various issues relevant to both market and nonmarket means of resource allocation are surveyed. The lack of precision in general market situations is cited, calling for exact relationships between such pertinent concepts as public goods, externalities, appropriability and exclusion. It is pointed out that the absence of conditions which assure a Pareto efficient competitive equilibrium situation usually results in resorting to nonmarket channels of resource allocation, such as government expenditures, taxes and subsidies. Externalities are also analyzed in terms of criteria, namely, benefit cost and second best analyses. The import of transaction costs on market failure is also discussed in some detail, particularly in relationship to monetary theory and in the identification of such costs in different contexts and under different systems of resource allocation. It is proposed that a wide variety of social institutions exist which serve as compensation for the failure or limitation of the market, although each of these involve transaction costs of their own. Economic analysis of these different contexts of choice is prerequisite to contemporary resource allocation. (Murphy-Rutgers)

A NOTE ON BIASES IN CAPITAL BUDGETING INTRODUCED BY INFLATION,
Stanford Univ., Calif.
James C. Van Horne.
Journal of Financial and Quantitative Analysis, Volume VI, Number 1, p 653-658, January 1971.

Descriptors: *Capital costs, *Budgeting, *Investment, Economic analysis, Decision-making, Risk, Financing, Prices, Debt, Prices.
Identifiers: *Inflation, *Capital allocation, Cost of capital rates, Acceptance criterion, Cash flows, Taxes, Price index.

The importance is considered of anticipating inflation in cash-flow estimates tend to eliminate the bias which arises due to the cost-of-capital rate generally used as the acceptance criterion. This article investigates the nature and origin of this bias. A hypothetical investment situation is proposed, which uses the cost-of-capital rate for project selection. In this situation, it is assumed that there is no capital rationing, that acceptance of the investment project will not alter risk complexion, and that the capital structure consists entirely of equity. A discussion of inflation is then presented and the need for incorporating an element of anticipated inflation is proven. It is also indicated that the correspondence of this element to the rate of anticipated inflation, as indicated by price index changes, depends upon the preference functions of investors relative to the price index employed. This article is valuable for use in reference to water resource investment projects, since it illustrates the importance of accounting for anticipated inflation in long-term decision-making. 6D. Water Demand

PROVIDING REASONABLE WATER SERVICE,
American Water Works Association, New York.
Abel Wolman.
In: Water, Health and Society, Bloomington, Indiana University Press, p 133-142, 1969.

Descriptors: *Water supply, *Water utilities, Economic analysis, *Water demand, Natural resources, Industrial water, Capital cost, Investment, Cost-benefit analysis, Water treatment, Reservoirs, Taxes, Financing, Population, Conservation.
Identifiers: *U.S. Geological Survey, *Water service, Inflation, Depression, Consumers.

This article presents common water consumer complaints and suggests reasonable water service to counteract these difficulties. The author begins by surveying water difficulties in the United States and several selected foreign countries such as Great Britain, Manila, and Japan. Among the causes of inadequate water service are scarcity of materials and manpower, inflation, increased per capita water use, rapid industrial expansion, population growth, metropolitan growth, public inertia, restrictions on increases in water rates, and prevailing waterworks opinion over the last half century. The nature of reasonable water service is proposed as consistent and continuously available water ser-

vice for all sensible water use demands. Several steps are proposed as preparation for achieving this reasonable water service, such as maintenance of continuing technical review, development of criteria of adequacy, development of public relations programs, reconciliation of costs and income, provision of machinery for metropolitan areas, and reexamination of improvement financing. The major problem cited is the economic aspect of water improvement programs and the cost and revenue problem is dealt with in some detail. (Murphy-Rutgers)

THE DEMAND FOR LEISURE,
New School for Social Research, New York.
John D. Owen.
Journal of Political Economy, Vol 79, No 1, p 58-76, January/February 1971.

Descriptors: *Recreation demand, Regression analysis, Price elasticity, Least squares method.
Identifiers: *Complementarity, *Demand for leisure, Income elasticity, Full income, Autocorrelation, Measurement error.

The relationship is considered between the demand for leisure time and the demand for market recreation, a closely related good. Complementarily between leisure time and market recreation is estimated empirically be regressing the demand for leisure time of U.S. employees from 1900-1961 on the relative price of recreational goods and services, holding real income and the relative price of leisure constant. The regression estimates support the hypothesis that leisure time and market recreation are complements with 25 percent of the estimated long term increase in demand for leisure explained by a decline in market recreation prices. Improvements in the estimation of the demand for leisure time were obtained when the price of recreation was used as a regressor and when the effects of changes in the unemployment rate on the demand for leisure is considered. This paper is relevant to water studies concerned with the demand for water-based recreational facilities. (Siegenthaler-Rutgers)

PUBLIC WATER FOR RURAL AREAS AND SMALL TOWNS,
Missouri Univ., Columbia. Dept. of Agricultural Economics.
Coy G. McNabb, and Melvin G. Blase.
Missouri University Cooperative Extension Division Report MP105, 1969. 12 p, 2 tab. OWRR Project No A-018-MO (2).

Descriptors: *Public utilities, *Water supply, *Missouri, *Rural areas, Water distribution (Applied), Water management (Applied), Water policy, Water utilization, Distribution systems.
Identifiers: Rural water systems.

The number of rural water supply systems in Missouri has increased since 1965, the year the Farmers Home Administration expanded its loan program for this purpose. FHA offers financial assistance to two general types of water distribution organizations, (1) municipal systems which include villages, towns, or cities with less than 5,500 population, and (2) rural districts. Problems and characteristics of districts which were in operation at the time of study are described. (Knapp-USGS)

WATER REQUIREMENTS FOR MANUFACTURING,
Business and Defense Service Administration, Washington, D.C. Water Resources and Engineering Service Div.
K. L. Kollar, and R. Brewer.
Journal American Water Works Association, Vol 60, No 10, p 1129-1140, October 1968. 9 tab, 7 ref.

Descriptors: *Water requirements, *Census, Withdrawal, Treatment, Brackish water, Rates, Water reuse, Sea water, *Water utilization, *Industrial plants, *Industrial water.
Identifiers: *Source of water, *Recirculation, Economic projections, Large water-using manufacturers.

This is a statistical presentation of national developments in recent years in the industrial water usage field. Further, it lays down some basic guidelines which must be reasonably followed if the nation is to continue to develop and prosper with the relatively fixed amount of total water available. Some properties of large water-using manufacturers were discussed. The data indicate the source of the increased demands will be company-controlled surface fresh water sources and brackish supplies rather than wells or public water system. Treatment and uses of water in manufacturers were discussed. It was estimated that the overall recirculation rate was 1.10 and it was noted that higher recirculation rates were found in regions where water is least abundant. The relation between water consumption and manufacturing production was discussed. Tabulated data presents the projected series of important economic parameters and the quantities of manufacturing water associated with them. This paper pointed out an important trend of reuse of waste water and recirculation in manufacturing. (Wang-Rutgers)

WATER USE BY APPALACHIAN MANUFACTURERS,
Business and Defense Service Administration, Washington, D.C. Water Resources and Engineering Div.
K. L. Kollar, and R. Brewer.
Water use by Appalachian Manufacturers-1964, p 1-28, December 1967. 37 tab, 9 charts.

Descriptors: *Water use, *Appalachia, Profiles, Productivity, Census, Water costs, Value added, Water utilization, Industrial plants, Industrial water.
Identifiers: *SIC, Non-Appalachia, Recirculation ratio.

This is a report concerning the use of water by industries in Appalachia and the relationship of that use to other economic factors. The availability of water in Appalachia, manufacturing and U.S. economy, water use in U.S. manufacturing, manufacturing in Appalachia, and water use by Appalachian manufacturers were discussed. The scope of work involved the use of data from the 1964 Census of Manufacturers from those manufacturing establishments which use more than 20 million gallons of water annually. Special extractions of data were made to permit comparisons of establishments within Appalachia with those in non-Appalachia conterminous United States. Other economic data for the same year and geographic areas, such as employment, value added, value of shipments, water conservation by reuse and recirculation were presented. Profiles of selected industries included poultry and small game, paper mills, paperboard mills, alkalies and chlorine, plastic materials, blast furnace, iron steel, and drugs were presented, water use in th industries were discussed. The large quantities good quality water that are available can be utili to further the industrial and economic devel ment in Appalachia. (Wang-Rutgers)

UNITED STATES V BIG HORN LAND A CATTLE CO (FORFEITURE OF RIGHT-O WAY ON PUBLIC LAND).

17 F2d 357-366 (8th Cir 1927).

Descriptors: *United States, *Right-of-way, *Easements, *Dams, Diversion, Lakes, Legal aspects, Judicial decisions, Federal government, Diversion structures, Diversion dams, Structures, Ditches, Irrigation ditches, Irrigation, Governments, Water levels, Elevation, Height.

Defendant obtained from plaintiff United States a right-of-way entitling defendant to construct and maintain a ditch and to dam a public lake for purposes of irrigation. Plaintiff sought a decree of forfeiture, contending that defendant had not within the required period constructed facilities capable of raising the water level of the lake to the height specified in defendant's application for the right-of-way. Defendant contended that, although it had not raised the water level the specified 16 feet, it had constructed a ditch system and a small dam, all of which should be considered in evaluating the extent of defendant's performance. The Eighth Circuit Court of Appeals reversed a judgment for defendant. The Act of 1891, under which rights-of-way in public lands were granted for purposes of irrigation, provided for forfeiture of any section of a right-of-way where substantial construction had not occurred within 5 years of the grant. The proposed reservoir was a section separate from the ditch in the instant case. Sufficient reservoir construction was not accomplished. Defendant's exclusive right-of-way continued only as to the ditch and diversion facilities. (Dye-Florida)

5 YEARS OF IMPROVEMENT IN WATER UPPLY QUALITY,
merican Water Works Association, New York.
bel Wolman.
: Water, Health and Society, Bloomington, Indiana University Press, p 93-103, 1969.

escriptors: *Water supply, *Water quality, Water treatment, Filtration, Chlorination, Coagulation, Watersheds, Sewerage algae, Potable water.
entifiers: *American Water Works Association, hemical industry, Odor, Taste, Consumer.

his article discusses the various efforts of the merical Water Works Association, in both chnological and scientific fields, to provide water maximum usefulness and satisfaction to the conmer over the last 75 years. Advances in water pply such as effective coagulation, sedimentaon, filtration, disinfection and the use of chlorinaon are surveyed as milestones in water supply ality. Specific water quality analysis difficulties e assessed from the points of view of both the ater diagnostician and the consumer. Particular tention is given to the identification of sources d causes of taste and odor, and the relationship these to algae and to the burgeoning chemical instry. The use of such remedies as powdered acated carbon, ozone, chlorination, and chlorine oxide is discussed. Advances in the water supply ality are attributed to the development of standrd methods of analysis and to the judicious use of mmercial equipment. A rapid trend is hypothesed toward the literal tailoring of water for the mestic, industrial, or farming consumer as quirements of water supply quality become more merous and complex. ONE V MAY (RIPARIAN RIGHT TO ACCREONS WHERE FORMER RIPARIANS' LAND AS ERODED).

5 NW 367-369 (Iowa 1929).

scriptors: *Iowa, *Accretion (Legal aspects), iparian land, *Boundaries (Property), Avulsion, Riparian rights, Riparian waters, Boundary disputes, Navigable rivers, Missouri River, Navigable waters, Bank erosion, Erosion, Channel erosion, Land tenure, Real property, Prescriptive rights, Legal aspects, Judicial decisions.

Plaintiff landowner sued defendant landowners to quiet title to the land between plaintiff's land and the east bank of the Missouri River. Plaintiff contended that at one time, the east bank had gradually eroded all the disputed land, leaving plaintiff as the riparian owner and entitling him to all the land since formed by accretion. Defendants asserted various decrees and sources of title, including adverse possession, and contended that portions of the river bed had changed by avulsion rather than by accretion. Affirming a judgment for plaintiff, the Supreme Court of Iowa noted that in the face of conflicting evidence, the presumption is in favor of accretion as against avulsion. The court held that plaintiff's one time riparian status entitled him to all later accretions even where such accretions covered property of former riparian owners. (Liptak-Florida)

ASD SECURITIES V J H BELLOWS CO (RIGHT-OF-WAY OF NECESSITY WHEN ACCESS BY WATER BECOMES IMPOSSIBLE).
48 Ohio App 101, 192 NE 472-473 (1933).

Descriptors: *Ohio, *Easements, *Right-of-way, *Navigable waters, Land, Land tenure, Judicial decisions, Legal aspects, Navigation, Real property, Ponds.

Plaintiff sought to enjoin defendants from interfering with a right-of-way of necessity which plaintiff claimed across defendants' land. Plaintiff had succeeded to a right-of-way across a pond to lands which plaintiff's predecessor had purchased from defendants. The pond dried up occasionally and became at such times impossible to cross. Because of this, plaintiff claimed a right-of-way of necessity across defendants' land. The Court of Appeals of Ohio ruled for plaintiff. There are many holdings that a way of necessity will not be held to exist where there is already access to property over a navigable body of water. However, such a rule is inapplicable where water becomes too shallow for navigation and becomes impassable due to sogginess. (Duss-Florida)

O'HEARN V TOWN OF ADAMS (DAMAGES FOR OVERFLOW OF SEWAGE).
288 Mass 185, 192 NE 524-527 (1934).

Descriptors: *Massachusetts, *Damages, *Overflow, *Sewage, Sewers, Streams, Channels, Land, Land tenure, Diversion, Maintenance, Cities, Legislation, Rivers, Eminent domain, Legal aspects, Judicial decisions.

Plaintiff landowners brought a tort action against defendant town for damages to land and property resulting from the overflow of a river and discharge of sewage from an alleged common sewer. Plaintiffs alleged that the damage complained of resulted from acts of the superintendent of sewers commencing sixteen years before filing of action. The superintendent had diverted stream water into a channel near plaintiffs' land and extended the sewer line to this channel. The Supreme Judicial Court of Massachusetts gave judgment for defendant. Private actions will lie against a municipality where it is negligent in maintaining a common sewer, control of which is authorized by statute. However plaintiff must show that the town was obligated to do the work resulting in injury or that it was an exercise of corporate power. Here the proximate cause of injury was not the building and maintenance of the sewer but diversion of the stream. Further, plaintiff must show acceptance by the town of the statute relating to laying out of sewers. In the instant case defendant had not accepted the statute. Liability could not be predicated on eminent domain as there was no taking of plaintiffs' land. (Duss-Florida)

GIVENS V CHANDLER (INJUNCTION TO PROHIBIT INTERFERENCE WITH WATER SUPPLY).

143 So 79-81 (La App 1932).

Descriptors: *Louisiana, *Wells, *Pipelines, *Water rights, Water sources, Artesian wells, Judicial decisions, Legal aspects, Pipes, Water conveyance, Water sources, Relative rights, Real property, Damages, Water supply, Water utilization, Easements, Natural use, Adjudication procedure, Reservation doctrine, Water contracts.

Plaintiffs sought damages and an injunction to prohibit defendant from interfering with plaintiffs' right to lay a pipe for the withdrawal of water from a well on defendant's property. Plaintiffs sold to defendant a lot adjacent to their own with a reservation in the deed retaining an undivided one-half interest in an artesian well thereon and the right to secure water therefrom. Plaintiffs laid a pipe from their lot to draw water from the well. Defendants acquiesced in such action and urged no objection to the pipe's use for over a year. Subsequently, defendant tore out the pipe and refused to allow plaintiff to reconnect it to the well. Plaintiff brought suit, and defendant alleged that the character of the servitude was not such as to allow the utilization of a pipe to withdraw the water from the well. The trial court held for plaintiffs, granting the injunction prohibiting defendant from interfering with plaintiffs' replacing the necessary pipe, but denying plaintiffs damages. The Court of Appeals of Louisiana affirmed issuance of the injunction and awarded plaintiffs damages. Where a defendant willfully breaches a contract such as the one in this case all damages arising from the breach are recoverable. (Barnett-Florida)

APPALACHIAN ELECTRIC POWER CO V SMITH (CONSTITUTIONALITY OF HYDROELECTRIC PROJECT LICENSING).
67 F2d 451-458 (4th Cir 1933).

Descriptors: *Dams, *Navigable rivers, *Nonnavigable waters, *Federal Power Act, Hydroelectric plants, Hydroelectric project licensing, Administrative agencies, Federal project policy, United States, Land tenure, Riparian land, Real property, Adjudication procedure, Judicial decisions, Legal aspects, Administrative decisions, Permits, Federal government.
Identifiers: *Constitutionality.

Plaintiff electric company sued defendant members of the Federal Power Commission individually to remove a cloud on title to riparian land. Plaintiff contemplated erecting a dam on a non-navigable tributary of a navigable river and filed a declaration of intent with defendant as a prerequisite for obtaining a permit. Defendant issued plaintiff a standard form license, which plaintiff refused; plaintiff then requested defendant to either disclaim jurisdiction over the project or issue a minor form license under provisions of the Federal Water

Power Act, which would only contain conditions prohibiting interference with the navigability of the main river. Defendant refused, whereupon plaintiff filed suit, alleging that defendant's acts were unauthorized and unconstitutional. Defendant moved to dismiss for lack of jurisdiction. The lower court denied defendant's motion, but dismissed the complaint on the merits. Since defendants as individuals had threatened no action to prevent dam construction, the United States Court of Appeals reversed, holding that the federal courts had no jurisdiction to enjoin defendant's actions. Furthermore, since the United States was not joined, the court held that it was without jurisdiction to set aside the alleged title cloud. (Hart-Florida)
W71-05977

UNION SAND AND GRAVEL CO V NORTHCOTT (TITLE TO LAND BETWEEN HIGH AND LOW WATER MARKS).

135 SE 589-593 (Sup Ct App W Va 1926).

Descriptors: *West Virginia, *Low water mark, *Ownership of beds, *Boundary disputes, Boundaries (Property), River beds, Bands, Navigable rivers, Rivers, Navigable waters, Land, Real property, Legal aspects, Judicial decisions, Public rights, Riparian rights, Riparian land, Navigation, High water mark, Legislation, Beds under water, Streambeds, Gravels, Sands, Islands.

Plaintiff sought to recover the value of sand and gravel removed by defendant gravel company from island property above the low water mark. Plaintiff claimed title to the low water mark. Defendant contended that: (1) plaintiff's title was only to the high water mark; (2) if to the low water mark, plaintiff's title was only to the ordinary low water mark; and (3) plaintiff's title, if to the low water mark, should be to that level as modified by existing locks and dams. The Supreme Court of Appeals of West Virginia affirmed judgment for plaintiff. The owner of land bounded by a navigable river holds title to the low water mark, subject only to the public right of navigation. In determining boundaries, the low water mark is the farthest ebb of the tide, not the ordinary low water mark. The low water mark is to be determined with respect to the river in its natural condition and is not altered for legal purposes by public construction of dams or locks. (Dye-Florida)

HOME REAL ESTATE LOAN AND INS CO V PARMELE (STATE MAY PASS TITLE TO NON-NAVIGABLE TIDAL WATERS).
214 NC 63, 197 SE 714-719 (1938).

Descriptors: *North Carolina, *Tidal waters, *Coastal marshes, *Reservation doctrine, Land reclamation, Legal aspects, Judicial decisions, Remedies, Federal government, State governments, Navigable waters, High water mark, Low water mark, Ownership of beds, Swamps, Dredging, Channel improvement, Tides, Tidal effects, Land tenure.
Identifiers: *Intracoastal waterway.

Plaintiff corporation asked for a court determination of whether it could transfer to defendant title to 2,000 acres of tidal marshland that plaintiff had purchased from the state board of education. Defendant had signed a purchase contract but refused to accept delivery, asserting that reclamation of some of the land had revested title in the state. The Supreme Court of North Carolina affirmed a decision for plaintiff. The state has title to all beds under navigable water and may not convey the land for such purposes which would impede navigation. However, the American rule is that navigable waters are those that are in fact navigable, not merely tidal. The state thus could sell such lands constitutionally, and a statute allowed sale to plaintiff's predecessor in title. Plaintiff had fee simple title. Were the lands navigable, the state could merely have granted an easement for limited purposes to underwater land. When the title granted was fee simple, however, reclamation did not revest title in the state. (Hart-Florida)

EDWARDS V ATCHISON, T AND S F RR (PRESCRIPTIVE RIGHT TO DISCHARGE WATER).

15 F2d 37-38 (9th Cir 1926).

Descriptors: *California, *Discharge (Water), *Culverts, *Prescriptive rights, Surface waters, Railroads, Legal aspects, Judicial decisions, Precipitation excess, Conduits, Land, Damages, Surface drainage, Rain, Rainfall, Erosion, Real property, Rain water, Surface runoff, Riddance (Legal aspects).

Defendant railroad held a right-of-way adjacent to plaintiff's land. The right-of-way was elevated and allowed the passage of water through it only at the location of a culvert discharging onto plaintiff's property. Heavy rains resulted in damage to plaintiff's land when water was discharged in large quantities from the culvert. Plaintiff sought damages. Defendant contended that a prescriptive right to discharge water onto plaintiff's land has been established. After judgment for defendant, plaintiff appealed, contending only that no prescriptive right had arisen since no prescriptive period begins to run until the servient tenement has been injured. The Court of Appeals for the Ninth Circuit affirmed the judgment for defendant. Evidence showed that water had been discharged onto plaintiff's property for a sufficient period. Each such discharge resulted in a cause of action, regardless of injury. The prescriptive right began to run after the first discharge. Further, the holder of a railroad right-of-way must have notice of the discharge of water and have been requested to remedy it before an action may be brought for injury. Interruption of use by dry seasons did not interrupt the continuity of the adverse use. (Dye-Florida)

KELLY V CITY OF CAPE GIRARDEAU (LIABILITY OF CITY FOR FAILURE TO PROVIDE ADEQUATE STORM SEWERS).
72 SW2d 880-884 (Ct App Mo 1934).

Descriptors: *Missouri, *Storm drains, *Damages, *Remedies, Cities, Floodwater, Drainage systems, Sewers, Overflow, Surface runoff, Flood damage, Surface drainage, Real property, Land tenure, Local governments, Flood protection, Legal aspects, Judicial decisions.
Identifiers: Injunction (Mandatory).

Plaintiff landowner sought compensatory and punitive damages for flooding of his land resulting from defendant city's inadequate storm sewers. Defendant, over a period of several years, had failed to comply with an injunction requiring it to replace the inadequate sewers. Plaintiff contended he was entitled to compensation for each incident of flooding not previously the subject of judgment. Defendant contended plaintiff's recovery of damages in a prior suit barred all claims arising prior to that action. The court held that when flooding results from an abatable nuisance, the wrong is re-created on each occasion of flooding. The injured property owner has the right to bring an action on each incident of flooding, notwithstanding prior judgment on other such incidents. Noting that the defendant's failure to comply with the prior injunction entitled the plaintiff to punitive as well as compensatory damages, the court affirmed the lower court's award of damages. (Earl-Florida)

TOLCHESTER BEACH IMPROVEMENT CO OF KENT COUNTY V BOYD (ABILITY OF PUBLIC TO ACQUIRE PRESCRIPTIVE ACCESS TO WATER).

156 A 795-798 (Md App 1931).

Descriptors: *Maryland, *Contracts, *Prescrip
rights, *Riparian land, Claims (Contracts), Rip
an rights, Legal aspects, Judicial decisions, E
ments, Land, Land tenure, Roads, Public rights.

Plaintiff riparian landowner brought action
specific performance of a contract for sale
riparian land to defendant yacht club. Defend
refused to consummate the sale because: (1) a s
road encroached upon the property, so that it
insufficient for appellee's needs; and (2) co
commissioners had protested appellee's permi
erect docks because local fishermen had used
area for launching boats. After observing that
public could not by long-continued use h
acquired a prescriptive right-of-way across
land, the Court of Appeals of Maryland gran
plaintiff's prayer for specific relief. The road
acquired by condemnation and the co
acquired an easement only. The riparian right
the owner were unimpaired. (Hart-Florida)

cial decisions, Shores, Banks, Adjudica
procedure, Surveys, Meanders, Mapping, L
tenure, Taxes, Governments, State governments

Defendant received land, bounded by a n
navigable stream, in the partitioning of prop
among heirs. The partitioning court had used co
ses and distances to describe the tract. Howe
the courses and distances arrived at did not c
cide with the meanders of the stream. Plaintiff s
claimed title by forfeiture to the strip of land l
between the tract's boundary as partitioned and
water, contending that no taxes had been paid
the strip since the partitioning. The Supreme Co
of Appeals of West Virginia reversed a judgm
for plaintiff. Title to land bounded by a non-nav
ble stream extends to the thread of the stream.
entire original lot was bounded by the stream,
it was the duty of the partitioning court to incl
all of the original property in the new lots. It m
be assumed that the court did so. Those new lot
which the boundary did not coincide with
stream should have been presumed to ext
thereto. Natural monuments prevail over a
veyor's calls. (Dye-Florida)

ment, Local governments, Water law, Legislati
Eminent domain, Condemnation, Rivers, Strea
Lakes, Floods, Flood control.

Although originally flood control agencies,
Ohio conservancy districts are now empowered
conserve and develop water supply, impr
drainage, collect and dispose of wastes, provide
irrigation, and arrest erosion of the Lake E
shore. This booklet discusses the organization
conservancy district, the steps in development
district, questions and answers concerning
servancy districts, and the text of the Ohio
servancy district law. The law itself is set forth
eight parts: (1) definitions, (2) organization
district; (3) powers, duties, and organization

rvancy district boards of directors; (4) ap- l of benefits; (5) financial administration; (6) orporate relations and conflict in jurisdiction; olice powers and regulations; and (8) con- ion and interpretation of the law. In addition eviously mentioned powers, the district may: ter the course of rivers and streams; (2) fill bandoned or altered watercourse; (3) con- and operate dams; (4) plant forests on dis- and; and (5) acquire by purchase or power of nt domain easements or lands to effect the ses of the act. BLACK V TOWN OF BESSEMER CITY (DAMAGE TO LAND BY SEWAGE PLANT).

197 NC 195, 148 SE 29 (1929).

Descriptors: *North Carolina, *Cities, *Water pollution, *Sewage disposal, Eminent domain, Damages, Land, Real property, Remedies, Water pollution sources, Water pollution effects, Legal aspects, Judicial decisions, Legislation, Local governments, Sewage, Wastes, Diversion, Air pollution, Waste treatment, Waste disposal.

Plaintiff sought damages for injury to his property resulting from the erection of defendant town's sewage disposal plant. Plaintiff contended that he was damaged by the diversion of sewage water into a stream running through his land and by pollution of the stream and the atmosphere. The trial court ruled for defendant and plaintiff appealed, contending that he was entitled to at least nominal damages for injury done his land by pollution of the stream. The Supreme Court of North Carolina affirmed. Plaintiff's contention would have been correct but for a statute giving cities the right to establish sewer systems, implemented by the power of eminent domain. Thus plaintiff was not entitled to damages as a matter of law. (Dye-Florida)

DASHNER V WOODS BROS CONST CO (IMPLEMENTATION OF RIVER PROTECTION PROJECT).
217 NW 464-468 (Iowa 1928).

Descriptors: *Iowa, *Administrative agencies, *Erosion, *River training, Levees, Flood control, Drainage systems, Construction, Plans, Surveys, Contracts, Legislation, Benefits, Assessments, Land tenure, Rivers, Missouri River, Banks, Shores, Dams, Shore protection, Topography, Remedies, Legal aspects, Judicial decisions

Plaintiff landowners sought to prevent payment to defendant construction company for improvements along the Missouri River and to prevent assessment of landowners in a drainage district to pay for improvements. Pursuant to the Iowa drainage law, plaintiffs, among others, had petitioned for creation of a river protection district and for construction of improvements to prevent erosion of the banks of the Missouri River. Plaintiffs alleged that the board of supervisors exceeded its authority in carrying out the improvements and that there was not adequate compliance with the contract, plans, and specifications. The trial court dismissed plaintiffs' petition and the Supreme Court of Iowa affirmed. Evidence showed that the board carried out the improvements in a proper manner. The river banks were constantly changing due to erosive and cutting action of the water. It was proper for the board to appoint engineers with power to submit plans and determine the nature and location of necessary improvements. The board and all interested parties inspected the work as it progressed, and no objection was raised until after the project was finished. The board accepted the improvements, and, in the absence of fraud, plaintiffs could not now cancel payment for the work. (Duss-Florida)

HOWES V TOWN OF BARNSTABLE (OWNERSHIP OF CLAM BEDS).
285 Mass 361, 189 NE 34-37 (1934).

Descriptors: *Ownership of beds, *Massachusetts, *Clams, *Public rights, Land tenure, Shellfish, Land, Shores, High water mark, Permits, Damages, Legislation, Cities, Commercial shellfish, Legal aspects, Judicial decisions, Channels, Marshes.

Plaintiff sought to enjoin defendant town and others from interfering with his clam fishery located on a sand flat. Plaintiff further sought damages for the taking of clams and injury to the fishery. Plaintiff had acquired exclusive right to dig clams on the flat for a term of years. This right expired and was not renewed by the town. Plaintiff continued to dig clams without a permit and sought to acquire title to the area by acquiring two quitclaim deeds. Plaintiff also claimed that he acquired an adverse title as against all but the true owners by putting nets and signs around the flat signifying his ownership. The master dismissed plaintiff's bill and the Supreme Judicial Court of Massachusetts affirmed. Plaintiff failed to sustain the burden of proving his title to the premises. The evidence did not show that plaintiff's grantors possessed any interest in the property. The spreading of nets and erection of signs without inclosure, permit, or legislative sanction was ineffective to destroy the public right to take shellfish from the disputed area. Plaintiff's efforts at propagation and cultivation during the life of his license did not give him any rights in the fishery against the town after expiration of his permit. (Duss-Florida—)

STATE V MIDDLETOWN HYDRAULIC CO (VALIDITY OF WATER RIGHTS RESERVATION IN GRANT OF CANAL PROPERTY TO STATE).
114 Ohio St 437, 151 NE 653-665 (1926).

Descriptors: *Ohio, *Water rights, *Canals, *Milldams, Dams, Riparian rights, Riparian waters, Riparian land, Sluices, Flumes, Diversion, Diversion structures, Contracts, Water contracts, Land tenure, State governments, Public land, Public rights, Water utilization, Preferences (Water rights), Legal aspects, Judicial decisions.

Plaintiff state brought a quo warranto action to challenge defendant corporation's right to divert and use water from a state-owned canal. Defendant contended that his predecessor's grant of the canal property to the state reserved the water rights for the operation of a mill and that both the state and defendant's predecessors had recognized and preserved this reservation of water rights for 100 years. Plaintiff argued that: (1) the canal commission had no authority to acquire less than a free simple and must have fee simple, having been in

possession for 100 years, and (2) the original water rights were not a reservation from the title but a grant by the state, personal to defendant's predecessor and expiring upon his death. Affirming a judgment for defendant, the Supreme Court of Ohio held that plaintiff's possession was in recognition, not exclusion, of defendant's water rights for 100 years and is conclusive of the state's interpretation of its power to hold less than a fee simple. The court also noted that the reservation for a specific purpose only limited the quantity of defendant's water rights and not the use to which he might apply the water. (Liptak-Florida)
W71-06098

COUNTY OF BECKER V SHEVLIN LAND CO (RIGHT TO CONNECT NAVIGABLE STREAMS WITH HIGHWAYS).

243 NW 433-434 (Minn 1932).

Descriptors: *Minnesota, *Navigable rivers, *Highways, *Access routes, Administrative agencies, Streams, Navigable waters, Lakes, Benefits, Costs, Right-of-way, Beds, Ownership of beds, Public rights, Legal aspects, Judicial decisions, Land tenure, Legislation.
Identifiers: *Constitutionality.

Plaintiff land company sought to prevent defendant county from constructing a connecting road between a stream and a public highway. Plaintiff contended that a state act authorizing construction of connecting roads with navigable streams was special legislation and thus unconstitutional. Plaintiff also contended that a patent from the United States, describing the river bed as among plaintiff's lands, conveyed title to the bed. Therefore, the state had no interest in it. The district court issued an order appointing commissioners to appraise benefits and damages consequent upon the taking of the right-of-way for the highway. The Supreme Court of Minnesota affirmed. The state act authorizing connecting roads with navigable streams was not unconstitutional. There was no impropriety in authorizing a highway which would provide access to navigable streams. Title to beds of navigable streams is in the state unless conveyed by the United States prior to the state's admission to the Union. Such a conveyance never occurred, and the government patent describing the river bed would not be construed as conveying title. Since the stream in question was navigable, and therefore public waters, the connecting road could be sustained as for a public purpose. (Duss-Florida)

QUINLAN V BOROUGH OF FAIR HAVEN (TITLE DISPUTE TO RIPARIAN LAND AND SUBMERGED LAND UNDER DOCK).

131 A 870-871 (NJ Ct Err and App 1926).

Descriptors: *New Jersey, *Docks, *Riparian land, *Ownership of beds, Piers, Riparian rights, Riparian waters, Roads, Public rights, Navigable waters, Shores, Banks, Prescriptive rights, Land tenure, Real property, State governments, Legal aspects, Local governments, Piles (Foundations), Jucidial decisions, Bulkheads.

Plaintiff riparian owner sued to eject defendant town from a road leading to a wharf and from submerged land over which the wharf was built. Plaintiff traced her title to the road through various deeds and her title to the submerged land to a riparian grant from the state. Defendant claimed title through: (1) a deed conveying all the right and title of a dock company which had used the land, and (2) adverse possession. Affirming a judgment for plaintiff, the Court of Errors and Appeals of New Jersey noted that the dock company's charter of incorporation gave it no title to land which it did not already own. Thus the company had no title to convey to defendant. The court also noted that defendant's possession of the submerged land was not adverse since: (1) the dock company's charter constituted an express license to use the land; and (2) title by prescription cannot be secured against the public, which held the property before its conveyance to plaintiff. (Liptak-Florida)

MILLER V COMMONWEALTH (TITLE TO VIRGINIA TIDAL MARSHES).
166 SE 557-567 (Sup Ct App Va 1932).

Descriptors: *Virginia, *Ownership of beds, *Tidal marshes, *Boundary disputes, Boundaries (Property), Legislation, Recreation, Legal aspects, Judicial decisions, Land, Real property, Marshes, Rivers, Banks, Riverbeds, Tidal waters, High water mark, Low water mark, Hunting, Riparian land, Land tenure, Beds, Beds under water, Streambeds.

In a criminal prosecution for unlawfully hunting on the lands of another without the owner's consent, defendant hunter was convicted. The land on which defendant had hunted lay between the high and low water marks on the banks of the James River. Defendant contended that the owner of the upland did not own the property on which he hunted. The Supreme Court of Virginia affirmed his conviction. Without specific language to the contrary, a Crown grant of uplands did not include the adjacent tidal marshes. However, an act of the legislature in 1819 granted the land between the high and low water marks to the holder of the adjacent uplands, where such land had not been used as a common by the public. A proviso in an act of 1792 reserving beds of rivers to the states applied only to conveyances made after 1792. The land in question was granted prior to 1760 and was never used by the public in common. (Dye-Florida)

OLIVER V CITY OF RICHMOND (COMPENSATION FOR STATE DIVERSION OF A NAVIGABLE STREAM).
178 SE 48-53 (Sup Ct App Va 1935).

Descriptors: *Virginia, *Diversion, *Eminent domain, *Navigation, Navigable rivers, Legal aspects, Judicial decisions, Condemnation, Damages, Land, Real property, Riparian rights, Navigable waters, Compensation, Riparian land, Rivers, Running waters, Ownership of beds, Governments, State governments, Federal government, Riparian waters, Alteration of flow, Public rights.

To improve navigation defendant city sought to divert the waters of a navigable river into an artificial channel. Plaintiffs claimed a property right in the river's current and sought compensation for the decrease in value of their property resulting from defendant's diversion. Plaintiffs contended that only Congress was empowered to improve navigation without compensating landowners for depriving them of access to the flow. The Supreme Court of Appeals of Virginia reversed a judgment for plaintiffs. Beds of navigable rivers belong to the state. Riparian owners' right to a normal flow of water in a river's natural course is subject to the government's power to improve navigation. Where the government exercises its right to improve navigation, only those landowners whose properties are taken must be compensated, not those who are being deprived of an incidental and subservient right. Deprivation of such rights is not a taking requiring compensation, whether accomplished by the federal government or a state. (Dye-Florida)

GEORGE F FISH FARMS V STATE (STATE LIABILITY FOR FLOODING FARM).
135 Misc 188, 237 NYS 383-390 (Ct Cl 1929).

Descriptors: *New York, *Flooding, *New Yo State Barge Canal, *State governments, Cana Condemnation, Eminent domain, Compensatio Payment, Crops, Water injury, Flood damag Damages, Riparian land, Ditches, Drainage, Leg aspects, Judicial decisions, Farms, Dams, Rainfa Lakes, Littoral, Agriculture, Muck soils.

Plaintiff lessee sued defendant state for damag caused by flooding. Plaintiff leased muckland ne a lake, prepared it, and planted vegetables. Th tract was drained by a ditch to the lake. The lak rose into the ditch, flooding the land and destroyin plaintiff's crops, although flooding had not o curred before. The lake was part of a barge cana and defendant had constructed a dam downriv from the lake, raising its level about 2 1/2 fee Various riparian owners were then compensate for flooding, after two test decisions. Plaintiff con tended that these decisions required that defendar be held liable, but defendant asserted that sinc plaintiff's tract was not on the lake and the floo was caused by rainfall, it was not liable. After no ing that the proper measure of damages was renta value, plus preparation and planting costs, th Court of Claims of New York stated that it was im material that plaintiff's tract was not littoral. Deter mining the evidence sufficient to establish that th dam caused plaintiff's injury, the court held tha the prior decisions were binding and adjudged de fendant liable. (Hart-Florida)
W71-06163

COLONNA V STATE (DAMAGES FOR FLOODING OF QUARRY).
146 Misc 762, 262 NYS 846-847 (Ct Cl NY 1933).

Descriptors: *New York, *Damages, *Cana seepage, *Quarries, Leakage, Seepage, New York State Barge Canal, Legal aspects, Judicial decisions, Canals, Land, Real property, Pumping, De watering, Pumps, Drainage, Submergence.

Defendant state maintained a barge canal from which water seeped into plaintiff's quarry. Plaintiff sought as damages the value of stone which could have been removed from the quarry during each year of the seepage. The Court of Claims of New York affirmed a judgment for plaintiff in a reduced amount. Plaintiff could have operated the quarry during each of the years in question by pumping the water from the premises. He was entitled only to the cost of pumping sufficient water from the quarry to carry on his business, including depreciation of pumping equipment. If the quarry had actually been in operation over the period of the injury, plaintiff would have been entitled also to the loss of production between working the quarry under wet conditions and under dry conditions. (Dye-Florida)
W71-06164

CRAGE V CITY OF BUFFALO (DUTY OF CITY TO PROVIDE FOR SEWAGE DISPOSAL).
148 Misc 298, 265 NYS 640-643 (Sup Ct 1933).

Descriptors: *New York, *Cities, *Sewage disposal, *Canals, Easements, Sewers, Channels, Legal aspects, Judicial decisions, State governments, Local governments, Damages, Remedies, Wastes, Disposal, Open channels, Sewage, Waste disposal, New York State Barge Canal, Land, Landfills, Public health, Leases, Rent, Prescriptive rights.

Plaintiff owned property on a bank of the Erie Canal. While the canal was in existence, plaintiff passed sewage from his property into it. The state abandoned the canal and conveyed the canal property to defendant city. Defendant filled the canal, leaving a narrow channel of running water on each side of the fill. Plaintiff continued to pass sewage into one of these channels, but the current therein

is insufficient to carry solid wastes. Solid waste cumulated, creating a noxious odor which in- ced plaintiff's tenants to move. Plaintiff sued for s lost rentals, contending that: (1) his use of the nal to dump sewage had created in him a escriptive right to do so; (2) defendant, on filling e canal, was obligated to provide alternate means r disposal of sewage from plaintiff's land; and (3) fendant's action in leaving channels open nounted to establishment to a sewage system, nich, once created must be maintained in a oper manner. The complaint was dismissed. No escriptive right arose. Defendant was not ligated to provide plaintiff with sewage facilities. reation of the channel was incidental to filling the nal and not the creation of a sewer system. (Dye- orida)

IRK V MAUMEE VALLEY ELECTRIC CO EASE OF WATER RIGHTS IN CANAL SUB- CT TO STATE'S RIGHT TO ABANDON ANAL).
9 US 797, 49 Sup Ct 507-510 (1929).

escriptors: *Canals, *Hydroelectric plants, Vater rights, *Water contracts, Surplus water, ontracts, Leases, Ohio navigation, Navigable aters, State governments, Legislation, Cities, ondemnation, Legal aspects.

aintiff hydroelectric power company sued to en- in defendant state public works supervisor from aining a canal, thereby stopping the supply of rplus water to plaintiff's power plant. Plaintiff ntended that draining the water was an impair- ent of the state's contract obligations under ases and grants of surplus water rights to plaintiff d amounted to taking plaintiff's property without ue process. Reversing a decree for plaintiff, the upreme Court of the United States noted that the atutes authorizing surplus water leases provided r cancellation only if hydroelectric production in- rfered with navigation or if the surplus water was eeded to improve navigation. However, the court eld that the statutes did not impose a duty on the ate to maintain the canal, and the state could andon the canal when no longer needed for avigation purposes without impairing plaintiff's ghts, since those rights were only incidental to the ublic right of navigation. TATE OF NEW JERSEY V STATE OF ELAWARE (LOCATION OF DELAWARE IVER BOUNDARY BETWEEN NEW JERSEY ND DELAWARE).
91 US 361, 54 Sup Ct 407-416 (1934).

escriptors: *New Jersey, *Delaware, *Boundary sputes, *Ownership of beds, Navigable waters, avigable rivers, Delaware River, Bays, Estuaries, hannels, Thalweg, Beds, Legislation, Riparian ghts, Prescriptive rights, Riparian land, Judicial ecisions, Legal aspects, Beds under water, State overnments, Rivers.

laintiff New Jersey sought determination of the oundary between Delaware and New Jersey in arts of the Delaware River and Bay. In one con- oversy title to the bed of the river within a twelve ile circle was at issue. Plaintiff claimed: (1) that efendant's chain of title was defective, and (2) tle by prescription. The second controversy in- olved the boundary line between the states in the ver below the circle and in the bay. Plaintiff laimed that the boundary between the states was ne thalweg. Defendant claimed title to the geo- raphical center. The Supreme Court of the United tates found for defendant in the first controversy nd for plaintiff in the second. First, defendant's tle derived from a valid patent of the British rown. A compact between New Jersey and elaware concerning various rights in the elaware River did not affect title in this area. laintiff never acquired title by prescription to the isputed area. Secondly, international law locates river boundaries between states at the middle of the channel as defined by the thalweg and not at the geographical center. The same doctrine applies to estuaries and bays where a dominant sailing channel can be found. (Duss-Florida)

COLGATE V PHILADELPHIA ELECTRIC POWER CO (CONSTITUTIONALITY OF CONDEMNATION OF PENNSYLVANIA LAND FOR OVERFLOW FROM MARYLAND DAM).
20 F2d 263-264 (ED Pa 1927).

Descriptors: *Pennsylvania, *Maryland, *Eminent domain, *Hydroelectric power, Electric power production, Electric power industry, Backwater, Damsites, Design flood, Hydroelectric plants, Water law, Remedies, Maximum probable flood, Real property, Condemnation, Compensation, Dams, Legal aspects, Judicial decisions.
Identifiers: *Constitutionality.

Plaintiff landowner sought to enjoin defendant power company from condemning his land. The land was in Pennsylvania, but was to be condemned for overflow by backwater from a Maryland dam for the benefit of a Maryland corporation. Plaintiff contended that a taking by defendant Pennsylvania corporation for the benefit of a Maryland corporation was not for a public purpose in Pennsylvania and was hence unconstitutional. It was determined that the Maryland damsite was the only one available, and that the Maryland company was formed for the sole purpose of satisfying Maryland law. The power generated was to be used to serve the Pennsylvania public. Hence the federal district court rejected plaintiff's assertion and dismissed the complaint. (Hart-Florida)

UNITED STATES V HAYES (TITLE TO STREAMBED FORMERLY PART OF INDIAN RESERVATION).

20 F2d 873-890 (8th Cir 1927).

Descriptors: *Ownership of beds, *Oil, *Boundary disputes, *Indian reservations, Boundaries (Property), Land tenure, Real property, Civil law, Riparian land, Non-navigable waters, Intermittent streams, Legal aspects, Judicial decisions, Beds under water.

Plaintiff United States brought action to determine title to streambeds in a non-navigable river. The river passed through what was formerly the Creek Indian reservation; oil had been discovered under the river bed. In the original treaty between plaintiff and the Creeks, the Creeks were recognized as a self-governing nation within the United States, and all the lands of the tribe were jointly owned by its members. This scheme proved unworkable, and the lands were alloted in fee among the members. Other portions were purchased outright. These various landowners claimed title to the thread of the stream, while plaintiff contended that the streambeds were reserved to the Creek nation in the allotment and purchase deeds. The Eighth Circuit Court of Appeals noted that under both common and civil law, without consideration of the intent of the parties, the conveyance would extend to the thread of the stream. However, determining that the parties' intent prevailed, the court undertook an extensive examination of the allotments and held that the parties had never intended to reserve the streambed to the non-existent Creek Nation. Accordingly, title of the various riparian owners was held to extend to the thread of the stream. (Hart-Florida)

HOGUE V STRICKER LAND AND TIMBER CO (NAVIGABLE RIVER AS BOUNDARY BETWEEN STATES).
2 F Supp 905-908 (SD Miss 1933).

Descriptors: *Mississippi, *Louisiana, *Boundary disputes, *Boundaries (Property), Accretion, Mississippi River, Islands, Navigable rivers, Channels, Judicial decisions, Legal aspects, Riparian rights, Riparian land, Alteration of flow, Adjudication procedure, Rivers, Erosion.

Plaintiff owned property fronting on the east side of the Mississippi River. The river shifted westward toward the Louisiana side, depositing accretions to plaintiff's mainland. An island on the Louisiana side of the river became connected to the Mississippi shore when the main channel of navigation in the river, forming the boundary between the states, changed from one side of the island to the other. Plaintiff brought an action to fix boundaries relative to the island and the accretions. Defendant Louisiana timber corporation claimed that the island was within the state of Louisiana. The federal district court held that while the navigable river forming the boundary between the states was gradually shifting, the boundary between the riparian parties as well as between the states shifted with the river. However, when the main channel of the river changed from one side of the island to the other the boundary between the states did not shift, but remained in the center of the old channel as it was when the water ceased to flow continuously therein. APPALACHIAN ELECTRIC POWER CO V SMITH (FEDERAL POWER COMMISSION'S POWER TO REGULATE PROJECTS ON NON-NAVIGABLE RIVERS).
4 F Supp 6-25 (WD Va 1933).

Descriptors: *Federal Power Act, Navigable waters, *Non-navigable waters, *Administrative agencies, Administrative decisions, Permits, Rivers and Harbors Act, Legislation, Navigable rivers, Flow, Federal project policy, Projects, Obstruction to flow, Dams, Reservoirs, Ownership of beds, Regulation, Federal government, Federal jurisdiction, Navigation, Legal aspects, Judicial decisions, Interstate.
Identifiers: Interstate commerce.

Plaintiff power company sought to enjoin defendant Federal Power Commission from acting unlawfully in approving plaintiff's proposed power project. Defendant, under the Federal Water Power Act, had offered to issue plaintiff a standard license under the Act after a finding that the project would affect interstate commerce. Plaintiff refused this license, claiming that the Commission was without jurisdiction over the project. Plaintiff offered to accept a less stringent license complying with the protection afforded navigation under the Rivers and Harbors Act. The project was to be build on a non-navigable river which fed into a navigable river. Defendants moved to dismiss plaintiff's bill and the federal district court granted the motion. Under the Act, Congress is without jurisdiction over non-navigable streams not in public lands or reservations of the United States where obstruction of such streams would not affect interests of interstate or foreign commerce. However, upon application for a project, it is for the Commission to determine whether interests of interstate or foreign commerce would be affected by such construction. Though courts are not bound by the Commission's findings, in this instance their finding that the proposed project would affect interstate or foreign commerce on a navigable river was supported by the evidence. WATER-USE LAW AND ADMINISTRATION IN WISCONSIN,
Wisconsin Univ., Madison. School of Law.
Harold H. Ellis, J. H. Beuscher, Cletus D. Howard, and J. Peter DeBraal.
Wisconsin Univ Extension, Madison, Department of Law, 1970. 720 p, 6 fig, 11 tab, 8 append.

Descriptors: *Water law, *Wisconsin, *Legal aspects, *State jurisdiction, *Federal jurisdiction, Judicial decisions, Jurisdiction, Ownership of beds, Reparian rights, Public rights, Administrative decisions, Regulation, Water users, Admiralty, Water rights, Eminent domain, Overlying proprietor, Preferences (Water rights), Water rights, Economics.
Identifiers: *Private water rights, State agencies, Constitutional aspects, Evaluating water laws.

This book is a concise summary of legal aspects pertinent to water use in Wisconsin. It emanated from some 20 years investigations conducted by the University of Wisconsin Law School, partially under a four year contract between the University and the Department of Agriculture. The 19 chapters of the volume incorporate the following subject matter relevant to one of the major resources of the state: division of water; private rights to use water courses, diffused water, and groundwater; protection of water rights; public rights to use navigable waters; the role of state agencies, particularly the Department of Natural Resources, in control of water level and pollution; the role of local government in the disposition of water; federal, interstate, and international rights in the use of water; evaluation of water laws. The appendixes provide illustrative legal decisions. The volume is a source book for all concerned with the use of water, including the riparian owners, irrigation farmers, industrialists, lawyers, administrators, and conservationists. Although the book deals primarily with Wisconsin, the experiences in this state may suggest solutions of water law problems in other areas. (Wilde-Wisconsin)

GEORGE W ARMBRUSTER, JR, INC V WILDWOOD (EFFECT OF BEACH EROSION AND ACCRETION UPTON TITLE TO RIPARIAN LAND).

41 F2d 823-831 (D NJ 1930).

Descriptors: *Accretion (Legal aspects), *Roads, *Riparian land, *Cities, Erosion, Beach erosion, Land tenure, Real property, Oceans, Atlantic Ocean, Legal aspects, Judicial decisions.

Plaintiff riparian owner sought to enjoin defendant municipality from maintaining a boardwalk on the bed of an avenue. Plaintiff contended that the boardwalk hindered his right of ingress and egress from his land on the ocean side of the avenue. In the course of its decision, the court noted the erosion and later accretion of plaintiff's land and the roadbed did not affect the dedication of the avenue or plaintiff's title. (Hart-Florida)

WATER, WATER EVERYWHERE---BUT: A STUDY OF THE POLITICO-ADMINISTRATIVE ASPECTS OF WATER DEVELOPMENT IN MONTANA,
Montana State Univ., Bozeman. Water Resources Research Center
Richard G. Sheridan.
Montana University, Joint Water Resources Research Center Report No 9, June, 1968. 286 p, 16 tab, 8 charts. WRR Project B-004-MONT (3)

Descriptors: *Montana, *Political aspects, *Legal aspects, *Water policy, *Administrative agencies, Prior appropriation, Leadership, Coordination, Economics, Management, Water allocation (Policy), Water rights, Beneficial use, Water law, State jurisdiction, Federal-state rights conflicts, State governments, Reasonable use.
Identifiers: *Administrative problems, Administrative aspects.

Montana is a water-abundant state, the water resources of which are extremely important to its economy. In this comprehensive report, all agencies and officials dealing with water resources administration and development are listed and discussed. The hierarchy of control over the state's water resources is outlined. The author believes that the present type of water resources management is duplicative, unwieldy, and inefficient. He outlines some of Montana's long-standing water problems and suggests new solutions. Water rights in Montana are basically modeled on prior appropriation, which can lead to waste and does not guarantee beneficial use. Irrigation, heavily subsidized by the federal government at a time when non-planting of crops is also subsidized, is wasteful of water. Recreational use should be the prime purpose of water resources in the west. The author then erects a model system of water resources administration for the state designed to be capable of handling efficiently the problems he has discussed. (Yensen-Arizona)

CONNECTICUT WATER LAW: JUDICIAL ALLOCATION OF WATER RESOURCES,
Connecticut Univ., Storrs. Inst. of Water Resources.
Robert I. Reis.
Report No 4, 1967. 215 p, 6 append. OWRR Project A-012-CONN (2).

Descriptors: *Connecticut, *Water law, *Water resources, *Riparian rights, Navigable waters, Non-navigable waters, Reasonable use, Dams, Ownership of beds, Diversion, Riparian land, Riparian waters, Water pollution, Water supply, Condemnation, Damages, Public health, Public rights, Legal aspects, Prescriptive rights, Navigation, Federal-state water rights conflicts, Recreation, Groundwater, Surface waters.

The first of four parts in this work discusses riparian rights in non-navigable waters; the discussion includes: (1) the nature of riparian rights, tracing the evolution of the reasonable use doctrine, including the prior occupation and natural flow theories; (2) specific reasonable use controversies, such as detention and dams, diversions, and non-municipal water pollution; (3) recreational use; (4) acquisition and protection of municipal water supplies; (5) municipal liability for sewerage, accelerated stream flow, and pollution; (6) extinction of the riparian right and loss of the 'right' to exercise existing riparian rights by estoppel, condemnation, and prescription; and (7) littoral rights on lakes and ponds. The doctrines of public and private rights in navigable waters are discussed in part two. Topics considered are: (1) the navigation doctrine, including a discussion of rules distinguishing navigable and non-navigable waters, (2) public rights in navigable waters; and (3) various riparian rights in navigable waters, including rights of access. Part three is devoted solely to groundwater, including both underground streams and percolating waters. Subjects included within the part four discussion of surface water are mills and ponds, sewerage assessments, and diffused surface water. (Hart-Florida)

CERTIFICATES OF FINANCIAL RESPONSIBILITY (OIL POLLUTION).
Federal Register, Vol 35, No 250, p 19644 (De 25, 1970). 1 p.

Descriptors: *Administrative agencies, *Water pollution, *Administrative decisions, *Water pollutio sources, Pollutants, Pollution abatement, Wate pollution control, Federal government, Ship Regulation, Water quality, Non-structural alterna tives.
Identifiers: *Financial responsibility.

The Federal Maritime Commission publishe notice of an extension of time for owners or opera tors of certain barges to apply for a certificate o financial responsibility. The extension unti February 15, 1971, was granted because a commis sion order provides that an applicant desiring a cer tificate of financial responsibility for potentia damages of oil pollution under the Water Quality Improvement Act should apply no later tha December 31, 1970. However, requests for specia consideration will be granted if good cause i shown. Since certain barges which are not self propelled and do not carry oil as cargo may be ex empt from the Water Quality Improvement Act financial responsibility requirements by legislation pending in Congress, and since nonreturnable application fees are under consideration, the Commission considers good cause to exist ipso facto for non-oil-carrying, non-self-propelled barges. STATE WATER CONTROL LAW.

Va Code Ann secs 62.1-44.2 thru 62.1-44.34 (Supp 1970).

Descriptors: *Virginia, *Water quality control, *Water pollution control, *Administrative agencies, Legislation, Water policy, Administration, Adoption of practices, Regulation, Non-structural alternatives, Water pollution, Pollution abatement, Waste disposal, Sewage districts, Sewage disposal, Institutional constraints, State governments, Permits, Adjudication procedure, Decision making, Oil wastes, Oily water, Water conservation, Water management (Applied), Legal aspects.

In the interest of protecting and improving Virginia's water-quality standards, the duties, jurisdiction, and regulatory powers of the State Water Control Board are set forth in this legislation. Article One contains an enunciation of public policy regarding protection of water quality and regulation of waste discharge, and an affirmation of state control notwithstanding past discharges of waste. Article Two details the: (1) appointment, qualifications, and compensation of State Water Control Board members; (2) inspection and investigatory powers of the Board; and (3) general powers and duties of the Board. Article Three lists procedures regarding application for discharge permits and certification of industrial waste discharge. Article Four specifies the Board's powers over sewage treatment plants and facilities. Enforcement and appeal procedures, appearing in Article Five, in-

de: (1) enforcement by injunction; (2) rules of dence to be used by the Board; and (3) the right udicial review of Board action. Article Six con- ıs the penalties imposed for: (1) violation of a cial order of the Board, (2) violation of a condi- ı imposed by certification, and (3) failure to perate with the Board. The Board's power to ulate pollution from boats and to prevent the charge of petroleum products is detailed in Arti- Seven. (Earl-Florida)

LEN V POTTER (RIGHT TO ERECT BOAT IST BELOW LOW WATER MARK).
5 NYS2d 790-793 (Sup Ct 1970).

scriptors: *New York, *Easements, *Riparian hts, *Right-of-way, Legal aspects, Boats, Boat- , Boat-launching ramps, Navigable waters, servation doctrine, Judicial decisions, Lakes, nership of beds, Riparian land, Riparian waters, blic rights.

Plaintiff easement owner brought action against defendant riparian landowner for damages and an injunction to prevent interference with plaintiff's use of a boat hoist located below low water mark in front of plaintiff's right-of-way. The easement was for 'ingress, egress, and regress with the right at all times. . .to pass or repass on foot and with animals or vehicles.' The determinative issue was whether plaintiff, as a member of the public, or as holder of the right-of-way, was entitled to maintain a hoist upon public land in the bed of navigable waters. The Supreme Court of New York stated: (1) a riparian (littoral) PROPRIETOR OWNS LAND ON THE BANK OF A RIVER OR LAKE; (2) riparian rights denote the right and profit appurtenant to the upland, subject to sovereign regulation for navigation; (3) riparian rights include: (1) use of water for bathing and domestic purposes, (b) wharfage to navigable waters, and (c) access to navigable waters. Riparian rights were held not to attach to plaintiff's easement. Furthermore, the court held that plaintiff's riparian rights as a citizen were not superior to defendant's, and plaintiff could not encrocah upon defendant's rights by maintaining the hoist. Accordingly, the complaint was dismissed. (Hart-Florida)

THE LAW OF WATER--INTRODUCTION; WATERCOURSES; PERCOLATING AND SURFACE WATERS.
In: Powell on Real Property, Vol 5, Matthew Bender and Company, New York, p 345-438 (1962). 94 p, 435 ref.

Descriptors: *Water law, *Watercourses (Legal), *Percolating water, *Surface waters, Repulsion (Legal aspects), Riddance (Legal aspects), Surface runoff, Drainage water, Natural flow doctrine, Alteration of flow, Reasonable use, Relative rights, Riparian rights, Diversion, Legislation, Remedies, Prescriptive rights, Water pollution, Drainage districts, Percolation, Subsurface runoff, Diffusion, Legal aspects, Prior appropriation, Civil law.

Three water law topics are considered in this treatise: (1) introduction to law of water; (2) watercourses, exclusive of appropriation and (3) percolating and surface waters, exclusive of appropriation. The introduction relates the scope and organization of the treatise. In the discussion of watercourses, the following areas are examined: (1) terminology; (2) English law of natural flow; (3) American law of reasonable use; (4) reasonableness of use, including purpose, destination, quantitative facts, pollution, alteration of flow, and other types of conduct; (5) alteration of permissible use by methods other than prescription; (6) alteration of permissible uses by prescription; (7) remedies; (8) state legislation (not including appropriation statutes); and (9) federal legislation. The percolating and surface waters section includes: (1) terminology; (2) percolating waters, including the English rule of unrestricted privilege, American evolution of reasonable use, California rule of correlative rights, and statutory conservation; and (3) surface waters, including the natural flow doctrine, common enemy approach, reasonable use, and statutory drainage districts. The three sections treated purport to cover the entire field of water law with the exception of the development and status of problems centering on the law of appropriation. (Hart-Florida)

SOIL AND WATER LOANS; LAND CONSERVATION AND DEVELOPMENT LOANS.
Department of Agriculture, Washington, D.C.

Code of Federal Regulations, Title 7, Chap XVIII, secs 1821.51 thru 1821.87 (1970). 8 p.

Descriptors: *Loans, *Farm management, *Water resources development, *Rural areas, Soil management, Costs, Federal government, Governments, Financing, Capital, Government finance, Investment, Credit, Conservation, Drainage, Forestry, Water management (Applied), Pastures, Pasture management, Water policy, Farms.

Pursuant to section 304 of the Consolidated Farmers Home Administration Act of 1961, provisions for soil and water loans are hereby established. Loan preferences and objectives are defined, and the qualifications for acquiring a loan are explained. Enumerated herein are the purposes for which such loans may be used. The following procedural and administrative requirements are considered: (1) terms of loans, (2) special requirements, (3) security requirements, (4) compliance with special laws and regulations, (5) loan processing and related functions, and (6) subsequent soil and water loans. Land conservation and development loans are provided in accordance with section 203 of the Appalachian Regional Development Act of 1965. The following are explained under land conservation and development loans: (1) eligibility; (2) loan purposes; (3) special requirements; (4) security requirements; and (5) procedures for making, approving, processing, and closing loans. JACOBS V UNITED STATES (COMPENSATION FOR LAND RENDERED MORE SUSCEPTIBLE TO OVERFLOW).
45 F2d 34-39 (5th Cir 1930).

Descriptors: *United States, *Condemnation, *Backwater, *Easements, Compensation, Eminent domain, Payment, Contracts, Rivers, Farming, Riparian land, Riparian rights, Dams, Design flow, Navigable rivers, Legal aspects, Judicial decisions.

Plaintiff riparian landowner sought compensation for land which had become more susceptible to overflow after defendant United States had erected a dam downriver. Defendant offered to purchase a flowage easement from plaintiff, but plaintiff rejected the offer and filed the instant action. The Fifth Circuit Court of Appeals observed that plaintiff could only recover upon an implied contract theory. Since defendant had foreseen that plaintiff's land would be damaged and require compensation, an implied contract was found. Furthermore, it was noted that a riparian owner had the right to enjoy the natural flow of the river without the burden of an artificial hindrance. Hence, the court stated that no public easement could arise without grant, dedication, or condemnation with adequate compensation, and held that plaintiff was entitled to damages. (Hart-Florida)

JONES V LOUISVILLE AND NASHVILLE RY (RECOVERY FOR FLOOD DAMAGE BY CONTRIBUTOR THERETO).
233 Ky 152, 25 SW2d 31-32 (1930).

Descriptors: *Kentucky, *Culverts, *Remedies, *Flooding, Surface drainage, Obstruction to flow, Legal aspects, Judicial decisions, Damages, Highways, Local governments, Channels, Floods, Ditches, Surface waters, Drainage, Sediment, Railroads, Natural flow.

Plaintiff landowner sued defendants, a railroad, the county and another landowner, to recover damages for flooding of his property. The county had acquired a right-of-way for the state highway commission to build a new highway, but contended that it could not be liable for negligent construction. The other landowner build a culvert from the highway to the back edge of plaintiff's lot, but claimed that if plaintiff had not extended the culvert to a small ditch on the railroad's property, the flooding would not have occurred. The railroad, whose drainage ditch clogged, backing water up onto plaintiff's property, also asserted that the flooding would not have occurred if plaintiff had

not connected its ditch with the larger culvert, bringing sediment into the ditch. The lower court sustained the county's demurrer and directed verdicts for the other defendants. The Court of Appeals of Kentucky affirmed, saying one who contributes to his own injury cannot recover for his wrong. (Morris-Florida)
W71-06303

CITY OF HARRISONVILLE V W S DICKEY CLAY MFG CO (ENJOINING CITY'S SEWAGE DISPOSAL INTO STREAM AS TEMPORARY NUISANCE).
61 F2d 210-215 (8th Cir 1932).

Descriptors: *Sewage disposal, *Municipal wastes, *Water pollution, *Pollution abatement, Sewage treatment, Sewage, Treatment facilities, Cities, Sewage effluents, Local governments, Water pollution sources, Waste water disposal, Riparian rights, Riparian land, Riparian waters, Remedies, Damages, Property values, Compensation, Judicial decisions, Streams.

Plaintiff corporation sued to recover damages and to enjoin defendant city from discharging sewage into a stream which flowed through plaintiff's land, thereby destroying its use as rented pasture. Plaintiff contended that defendant's sewage disposal was a temporary nuisance which could be abated by improving defendant's treatment system and also claimed as damages the cost of cleaning and restoring the banks of the stream. Defendant argued that the nuisance was permanent since the city could be afford the improvements and contended that plaintiff could only recover the difference in the land's value before and after the discharge. The Eighth Circuit Court of Appeals noted that a city is not justified in discharging sewage to the injury of other landowners and held that the nuisance was temporary, entitling plaintiff to injunctive relief. However, the court held that plaintiff was not entitled to the cost of cleaning the bank since nature would do so once the nuisance was abated. The cost of cleaning the banks was out of proportion to the value of the land and the actual damage to the land. (Liptak-Florida)
W71-06304

TALLASSEE POWER CO V CLARK (RIPARIAN RIGHTS IN RIVER BED AND IN FUTURE FLOOD WATERS AND ALLUVIAN).
77 F2d 601-605 (6th Cir 1935).

Descriptors: *Riparian rights, *Accretion (Legal aspects), *Islands, *River beds, Dams, Hydroelectric plants, Navigable rivers, Rivers, Navigable waters, Beds, Natural flow, River flow, Reasonable use, Flood waters, Floods, Flood control, Overflow, Riparian land, Riparian waters, Silts, Sediments, Silting, Relative rights, Water rights, Legal aspects, Judicial decisions.

Plaintiff brought action to recover for damages to farm lands on an island he owned in a navigable river in Tennessee. Plaintiff contended that the damage was caused by defendant's hydroelectric dams in North Carolina. Plaintiff contended that the dams increased the flow of water in the river, thereby destroying a ford which was plaintiff's only means of access of the island, and that the dams eliminated the usual spring overflow of the river, thereby depriving plaintiff of the alluvion, silt, and sediments which were usually deposited on the island and greatly enriched the soil. Defendant contended that: (1) plaintiff had no vested right to the use of the river bed as a ford since riparian owners own only to the low water mark in navigable rivers; and (2) the sediment deposits were caused by unusual floods, which are common enemies, rather than annual freshets; and (3) riparian owners have no vested right to future deposits. The Sixth Circuit Court of Appeals noted that the law clearly limits riparian title to the low water mark and reversed a judgment for plaintiff as to the destruction of the ford. Noting that riparian owners have no vested right to future accretions along the shore, the court distinguished plaintiff's claim to future deposits on his own land and found that riparian owners have a right to the flow of ordinary flood waters. The court reversed the judgment for defendant as to the floods and remanded for trial, noting that liability must depend on whether the dams constituted an unreasonable use of defendant's riparian rights. (Liptak-Florida)

THE BUREAU OF RECLAMATION'S ROLE IN AMERICA'S GROWTH,
Bureau of Reclamation, Washington, D.C.
Ellis L. Armstrong.
Water Resources Bulletin, Vol 7, No 1, p 175-184, February 1971.

Descriptors: *Water resources development, Land reclamation, Irrigation, Flood control, Recreation, Fish management, Wildlife management, Interbasin transfers.
Identifiers: *Bureau of Reclamation, *National development.

The Bureau of Reclamation was created to implement the Reclamation Act of 1902 and subsequent legislation to conserve and develop the water resources of the western states for maximum efficient use. This has been accomplished by the planning and construction of major multiple use projects which now supply water to approximately eight million acres of land which annually produce 52 million tons of food and fiber with a gross crop value of approximately $2 billion. Fifteen million people are served with municipal and industrial water supplies and hdyroelectric power from Bureau projects now returns $160 million annually to the Tresury. Flood control, recreation, and fish and wildlife enhancement are other major benefits. The Bureau of Reclamation is now undertaking a Westwide Survey of water resources and of the needs of the future which is more far-reaching than anything heretofore accomplished. The information accumulated during this ten-year survey will determine whether there is a necessity for consideration of major interbasin transfer of water supply. (Davis-Chicago)

ECOLOGY AND SPATIAL ANALYSIS,
Michigan Univ., Ann Arbor. Dept. of Geograph
James D. Clarkson.
Annals of the Association of American Ge raphers, Vol 60, No 4, p 700-716, December 19 2 fig, 33 ref.

Descriptors: *Ecology, *Methodology, *Envir mental effects, Theoretical analysis, *Plann *Water resources development, Geographical gions.
Identifiers: *Spatial analysis, Environmental de minism, Adaptive research.

This article examines some of the theoretical methodological considerations of importance water resources management and planning. Plac an ecological approach in the general framework American geographic thought indicates the use ness of distinguishing 2 trends in the developm of this thought--the one ecological, the other s tial. American geography tended to reject ecological approach because it was identified at early period with environmental determinism. spatial, non-functional, approach became dor nant. Although the two approaches are two ends a continuum, and thus connected, they arise fr and lead to different sets of questions which invo different approaches and different bodies theory. The ecological approach may be divid into four imprecise types--biological, human, c tural, and urban-political. The cultural-ecologi approach is particularly useful in analyzing obs cles to innovation acceptance in agricultu development because it emphasizes the analysis existent systems from different viewpoints. Fo sets of reality, or viewpoints, can be distinguish in this context--that of the scientist-observer, th of the change-agent, that of the cultivator, and th of the ideal-set of the cultivator. Only when t overlaps and conflicts of these sets are recogniz can a realistic appraisal be made. This is only a s gle instance of the potential of an ecological a proach. Spatial theory and ecological theory ha not yet been joined. The evident usefulness of bo indicates the importance of attempting such a joi

ng, and the futility of arguing for the ascendence of ne-over the other. (Davis-Chicago)

6G. Ecologic Impact of Water Development

HE ECOLOGY AND OCEANOGRAPHY OF EWER OUTFALLS,
cripps Institution of Oceanography, La Jolla, alif.
. A. Barnett, R. E. Davis, M. E. Silver, and R. R. Varner.
seminar held at Scripps Institution of Oceanogphy, Spring 1969. Scripps Institution of Oceanogphy, La Jolla, California, 1969. 19 p, 11 ref. SIO ef No 70-18.

escriptors: *Ecology, *Balance of nature, Oceanography, *Outlets, *Water pollution, Reviews, Effluents, Discharge, Water quality stanards, Food chains, Coastal engineering, Marine nimals, Marine microorganisms, California, Sea ater, Statistics, Sampling, Analytical techniques, nvironmental effects.
dentifiers: *Research objectives, *Research proram planning, Ecological effects.

special graduate seminar was held at Scripps in 969 to examine standards in use for defining 'pollion' in coastal waters of California, to survey exting and planned ocean outfalls, to determine hat type of investigations are required, and to exnine reports of a number of investigations for eir appropriateness and adequacy for the stated urpose. The participants of the seminar made the llowing recommendations: (1) all research roposals and/or contracts should be submitted to xternal, independent, objective referees; (2) more esearch and survey effort should be applied to roblems of: developing ecological 'indicators' of ollution, biochemical and physiological indices of ollution, measurement of the persistence of nonegradable fractions, particularly those of known oxicity, concentration factors in organisms, the atistical design of monitoring programs, methods f data analysis, review and presentation; (3) basic esearch needs to be done on: physiology of marine rganisms, sampling of marine organisms, commuty ecology and food chain structure, dynamics of oncentration factors through food chains, curents, turbulence, eddy diffusivity and mixing in the earshore regions; (4) there should be more cenalization of effort in the study of effects and reonal, long term planning of coastal waste sposal; (5) a great deal of effort needs to be put to the development of clear, unambiguous statements as to the standards to be maintained (or objectives to be met) for coastal water quality. AMAICA BAY AND KENNEDY AIRPORT: A ULTIDISCIPLINARY ENVIRONMENTAL TUDY.
maica Bay Environmental Study Group, N.Y.

ational Academy of Sciences, National Academy Engineering, Washington, DC, (1971). Two olumes, 23 fig, 2 map, 2 photo, 31 tab, 358 ref, 2 ppend.

escriptors: *Bays, *New York, *Airports, *Environmental effects, Ecology, Aquatic habitats, Environment, Fishing, Aquatic environment, Recreaon, Inlets (Waterways), Water pollution, Water ollution control, Pollution abatement, Sewage, redging, Runways, Pollutants, Landfills, Water ollution sources, Municipal wastes, Water polluon treatment, Administrative agencies, Estuaries, egal aspects.
dentifiers: *Jamaica Bay.

nder the auspices of the National Academy of ciences and the National Academy of Engineerg, the Environmental Studies Board produced this multidisplinary evaluation of the potential impact of the expansion of Kennedy Airport into Jamaica Bay. Dredging and landfills for airport and commercial construction have significantly altered Jamaica Bay, but it still functions as an imperfect marine environment and bird refuge. The benefits and costs of various means of improving air transportation are examined in the study, emphasizing that projected costs must include the value of ensuing environmental deterioration and diminution of the amenability of the area to residential and recreational development. Problems caused by sewage discharged into the Bay are also discussed. The roles of the various community, city, state, regional and federal agencies which must be involved in determining the future of the Bay area are examined. Regulatory solutions to the aircraft noise problem in the area surrounding the airport are discussed. The Board contends that regulatory measures controlling land use and inducing utilization of quieter planes are preferable to construction of more runways in Jamaica Bay. Further dredging and landfill would significantly worsen the environmental decay of the area, while not measurably improving the quality of air transportation above that level which may be obtained by alternative measures. 07. RESOURCES DATA

7A. Network Design

A PROPOSED STREAMFLOW-DATA PROGRAM FOR NEBRASKA,
Geological Survey, Lincoln, Neb.
H. D. Brice, F. B. Shaffer, and N. G. Stuthmann.
Geological Survey open-file report 1970. 63 p, 4 fig, 16 tab, 14 ref.

Descriptors: *Streamflow, *Data collections, *Hydrologic data, *Surface waters, *Nebraska, Evaluation, Planning, Watershed management, Streams, Regression analysis, Flood plain zoning, Gaging stations, Runoff, Discharge measurement, Peak discharge, Average flow, Water quality, Environmental effects.
Identifiers: Streamflow characteristics, Peak discharge recurrence intervals.

An evaluation of the available discharge data for Nebraska streams was made to provide guidelines for planning the future data-collection program. The basic steps in this evaluation procedure were (1) definition of the long-term goals of the program in quantitative form, (2) examination and analysis of all available data to determine which goals have already been met, and (3) consideration of alternate procedures and techniques to meet the remaining goals. In order to evaluate the stream records, regression analyses were made of discharge records at selected gaging stations. The analysis showed that application of the regression equations will not provide estimates of selected flow characteristics within the accuracy goals specified for either minor or principal streams. Proposals for changes in the present program include the conversion of some complete-record gaging stations to flood-record stations, establishment of additional complete-record stations on small drainage basins, and investigation of techniques for improving correlative estimates of low flow. Proposals also are made for expanding programs to protect the physical environment of streams. (Woodard-USGS)

THE SURFACE INSTRUMENT NETWORK OF THE UPPER COLORADO RIVER PILOT PROJECT,
Western Scientific Services, Inc., Fort Collins, Colo.
L. W. Crow, C. F. Chappell, and G. W. Jones.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 16-23, 1970. 8 p, 6 fig, 2 tab.

Descriptors: *Colorado River basin, *Weather modification, *Data collections, *Meteorological data, *Instrumentation, Precipitation gages, Networks, Evaluation, Water yield improvement.
Identifiers: San Juan Mountains (Colo).

The Upper Colorado River Pilot Project's goal is to augment precipitation in a 3,300 square mile area in the San Juan Mountains of southwestern Colorado through modification of wintertime cold orographic clouds. The first project phase, initiated in November, 1968, provided for installation and operation of a network of surface instruments to collect meteorological data to provide an understanding of the physical processes and sequence of storm events which occur in this area and to permit evaluation of precipitation augmentation operations. The instrument network design, procedures developed for areal distribution of precipitation, are discussed, and examples of precipitation patterns are presented. (See also W71-06133) (Knapp-USGS)

SNOW SURVEY TELEMETRY NETWORKS AND FUTURE PLANS,
Soil Conservation Service, Anchorage, Alaska. Water Supply Forecasting Branch; and Soil Conservation Service, Anchorage, Alaska. Snow Survey for Alaska.
William G. Shannon, and Ted G. Freeman.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, For Collins, p 98-101, 1970. 4 p.

Descriptors: *Telemetry, *Snowpacks, *Snowmelt, *Water yield, *Runoff forecasting, Snow surveys, Data collections, Hydrologic data, Runoff, Streamflow forecasting, Rainfall-runoff relationships.
Identifiers: *Snow survey telemetry.

To satisfy legislative, regulatory agency, and user demands for snowmelt water yield data, a telemetry system is proposed and its major properties are outlined. An ideal telemetry system would account for total precipitation, distribution, and depletions on a 'real time' basis for the total water-producing areas and their subwatersheds. Also, knowledge is needed to predict these same factors accurately for a future period. A scientist must prescribe the parameters to be collected, the frequency of sampling, and the distribution of stations or areal coverage before telemetry systems are designed and installed. The legislative authority and administrative policy must be compatible to achieve the overall objective. The electronic telemetry system should obtain and record information automatically on a preset time interval. The recorded information should be in such form that it can be processed by ADP techniques and retrieved from storage. The problem is to obtain, at a reasonable cost, hardware that is completely reliable and that operates unattended for nine months or longer at high-elevation data sites. This problem can be handled. THE AUTOMATIC HYDROLOGICAL RADIO REPORTING NETWORK, NEW ENGLAND DIVISION, CORPS OF ENGINEERS,
Office of the Chief of Engineers (Army), Washington, D.C. Civil Works Directorate.
Carleton H. Gray.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 102-107, 1970. 6 p, 5 fig.

Descriptors: *Flood forecasting, *Warning systems, *Telemetry, *Data collections, *Data transmission, Hydrologic data, Flood control,

Water levels, Flood protection, Reservoir operation, Data processing, Digital computers.
Identifiers: *Hydrologic data network.

As an integral part of a comprehensive plan of protection from flood hazards in New England area, the Corps of Engineers has designed an automatic data collection network. This radio operated network provides extensive hydrologic data including river, reservoir and tide levels, wind velocity and direction, barometric pressure and precipitation levels in five major New England river basins. At the central station the reporting network is interfaced directly with an IBM 1130 which can automatically interrogate the entire system and provide a complete printout in three minutes. BOTTOM SEDIMENT SAMPLING,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
P. G. Sly.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 883-898, 1969. 16 p, 6 fig, 3 tab, 6 ref.

Descriptors: *Sampling, *Bottom sediments, *Lake Ontario, Great Lakes, Instrumentation, Equipment, Cores, Data collections, Core drilling, Sediments, Sedimentology, Surveys, Lakes.
Identifiers: *Bottom sediment sampling.

Tests with sampling equipment during 1967 and 1968 in Lake Ontario showed that some of the bottom samples were badly disturbed. As a result of these tests, further extensive trials of bottom sampling equipment were conducted in Georgian Bay in 1968. These were designed to test the disturbance of the bottom sediments caused by ship movement and to test the efficiency and suitability of various types of sampling devices. It was found that under typical sampling conditions, bottom disturbance was induced by the ship when the total water depth was less than about 6 m. It was also induced by the ship when the total water depth was less than about 6 m. It was also found that the ship, during typical sampling procedures in deeper water, induced disturbance in the water column, beneath it, to a depth of at least 14 m. Tests were conducted with three types of Gravity corer, two multiple corers, and six Grab samplers. These tests were designed to show their usefulness for both biological and geological samplings. All three gravity corers proved efficient for particular tasks. The most successful bottom grab samplers were found to be the Ponar grab and the Shipek bucket sampler. A STUDY OF FRESHWATER SAND GRAIN SURFACES BY SCANNING ELECT RON MICROSCOPY,
Illinois Univ., Urbana. Dept. of Geology.
Ronald D. Stieglitz.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 351-356, 1969. 6 p, 5 fig, 13 ref. NSF Grant GA-1239, PHS Grant PH-FR 07030.

Descriptors: *Sands, *Electron microscopy, *Sediments, *Lakes, *Dunes, Lake Michigan, Great Lakes, Sedimentology, Quartz, Mineralogy, Stratigraphy, Paleolimnology.
Identifiers: *Electron microscopes (Scanning).

Five samples of sand from several different environments were studied with the scanning electron microscope. Samples were taken from a small lake in Door County, Wisconsin, Lake Michigan beaches, dunes in Door County, and the Indiana dunes. Elaborate sample preparation is not necessary, and observation of shape and rounding as well as very small textures imprinted on the surfaces are possible. Large numbers of grains can be routinely examined so that major textures and grain types can be easily located and their frequency more accurately estimated. Quartz as well as other mineral grains were studied. Textures are distinctive and add much information concerning physical and chemical conditions in the depositional environment. Several quartz grains were etched in hydrofluoric acid for periods of 5 to 15 min to study the effects of chemical attack and crystallographic control on surface textures. SOME UNUSUAL SURFACE WATER TEMPERATURE PATTERNS IN THE GREAT LAKES, AS DETECTED BY AIRBORNE RADIATION THERMOMETER SURVEYS,
Meteorological Service of Canada, Toronto (Ontario).
J. G. Irbe.
In: Proceedings Twelfth Conference on Great Lakes Research, May 5-7, 1969, University of Michigan, Ann Arbor: International Association for Great Lakes Research, p 583-607, 1969. 25 p, 21 fig, 5 tab, 25 ref.

Descriptors: *Water temperature, *Water circulation, *Great Lakes, *Weather, *Remote sensing, Aircraft, Lake Ontario, Lake Erie, Meteorology, Data collections, Thermometers.
Identifiers: Airborne radiation thermometry.

Since 1966 the Meteorological Service of Canada has undertaken a program of monthly surface water temperature surveys of the Great Lakes bordering on Canada using an airborne infrared temperature sensing instrument. During the three year period that the program has been in progress, many interesting features of the distribution of surface water temperature have been found. Maps showing some of the more unusual isotherm patterns deduced from these surveys are presented and discussed with reference to lake circulation and meteorological conditions. (See also W71-05561). (Knapp-USGS)

INFRARED PHOTOS CAN MAP SOILS,
Nebraska Univ., Lincoln. Agricultural Experiment Station.
Larry J. Cihacek, and James V. Drew.
Quarterly Serving Farm, Ranch, and Home, Vol 17, No 1, Spring 1970, p 4-8. 9 fig.

Descriptors: *Remote sensing, *Infrared radiation, *Soil-water-plant relationships, *Soil surveys, *Eluvium, Moisture stress, Drainage, Light penetration, Flood irrigation, Harvesting, Correlation analysis, Color, Aerial photography, Maps, Moisture availability, Photosynthesis, Valleys, Marshes, Humus, Seasonal, Precipitation, Soil moisture, Water table, Radiation, Range management, Soil management, Nebraska, Satellites (Artificial).
Identifiers: Leaf geometry, Mowing, Sand Hills (Neb), Semi-arid lands.

Infrared photos from remote sensing satellites of Nebraska's semi-arid Sand Hills help map soils for decisions in soil and range management. Soil, vegetation and water relations allow the mapping of this 19,300-square-mile area because of their ability to reflect invisible, near-infrared radiation. Soil differences across this wind-blown region are due to variations in soil moisture and vegetation. Well-drained soils have deep water tables, and vegetation must depend on seasonal precipitation for soil moisture. Drought stress in summer reduces accumulation of dark surfaces of humus. In swales and valleys, poorly drained soils have shallow water tables, which form marshes and humus-rich layers. Plants differ in near-infrared reflection properties because of variations in photosynthesis activity, moisture content, and leaf geometry. Actively growing, turgid plants reflect near-infrared light; moisture-deficient or dormant plants do not. Late May photos taken from 10,000 to 20,000 feet above ground in 1969 showed best correlation with ground surveys because of moisture effects on vegetation. Mowing, harvesting, and flood irrigation influenced reflectance. Conventional color photos at high altitudes are of limited value because light is scattered by haze. Infrared is lightly scattered. Figures show typical soil profiles and soil types from infrared and ground surveys. (Popkin - Arizona)

TV INSPECTION AND IN-PLACE GROUTING OF SEWERS,
J. H. White.
Water Wastes Eng, Vol 5, No 9, p 72-74, Sep 1968.

Descriptors: *Inspection, *Cost-benefit analysis, Equipment, Grouting, Sewers.
Identifiers: *Austin, Texas, *Television inspection, Sanitary sewers.

Experiences of Austin, Texas, in using television camera inspection and inplace grouting in sewers are reported. The first experience with television inspection was so successful that lines in question were rehabilitated at a cost less than twenty thousand dollars, instead of two hundred and forty thousand dollars as was considered previously. Television inspection equipment proved to be durable, and down-time was quite low. Television inspection has forced contractors and other utilities to respect sanitary sewers.

SUMMARY OF DATA ON TEMPERATURE OF STREAMS IN NORTH CAROLINA, 1943-67,
Geological Survey, Washington, D.C.
Thomas H. Woodard.
For sale by the Superintendent of Documents U.S. Government Printing Office, Washington, D.C. 20402 - Price $0.75. Geological Survey Water-Supply Paper 1895-A, 1970. 39 p, 1 fig, 1 plate, 2 tab.

Descriptors: *Water temperature, *Streams, *North Carolina, *Hydrologic data, *Data collections, Average, Fluctuation, Standards, Thermal water.
Identifiers: *Stream temperatures, Basic-data compilation.

Stream temperature data collected by the U.S. Geological Survey in cooperation with the State of North Carolina during the period 1943-67 are summarized. Values determined from 850 station years of record from 176 locations throughout the state are shown in two tables. Thirty-one percent of the station years are monthly records, 50 percent are daily, and 19 percent are continuous. Temperature tabulations include average monthly, average annual extremes observed for the period of record at each location, average of monthly maximums, average of daily maximums, average daily, average of daily minimums, and average of monthly minimums. WATER RESOURCES OF THE BLACK RIVER BASIN, SOUTHEASTERN MICHIGAN,
Geological Survey, Washington, D.C.
R. L. Knutilla.
For sale by US Geological Survey, Wash, DC, 20242, price $1.75. Geological Survey Hydrologic Investigations Atlas HA-338, 3 sheets, 1970. Text, 6 fig, 7 map, 2 tab.

Descriptors: *Water resources, *Surveys, *Hydrologic data, *Michigan, *Water resources development, Hydrogeology, Streamflow, Duration curves, Profiles, Hydrographs, Data collections, Topography, Geology, Geomorphology, Water supply, Water yield, Water quality.
Identifiers: *Black River Basin (Mich).

This 3-sheet hydrologic atlas is a part of a comprehensive study of the water resources of southeastern Michigan. The purpose of the atlas is to provide information on (1) the physical features of Black River and its tributaries, (2) the characteristics of streamflow, (3) the quality of ground and surface water, and (4) the groundwater aquifers of the area. Water from streams is of the calcium magnesium bicarbonate type and is very hard. Stream water is generally high in sulfates and, locally, high in chlorides. Water from shallow wells in the glacial drift is of the calcium magnesium bicarbonate type. Water from deep wells in the glacial drift is of the calcium magnesium bicarbonate, sodium bicarbonate or sodium chloride types. Water from bedrock wells may be of the calcium magnesium bicarbonate, sodium bicarbonate, sodium chloride, or mixtures of these types. Most wells completed in glacial drift in the southeastern one-third of the basin will yield only small supplies of water, and some will fail to yield even the small amount needed for a domestic supply. Somewhat larger supplies may be obtained from the glacial drift in the north and western parts of the basin. The outwash areas in the headwaters of Mill and Elk Creeks are the most favorable for obtaining large supplies of water. Maps show quality of water, physiography, geology, well yields, and groundwater levels. Stream profiles, hydrographs, tables, duration curves, frequency curves, and tabular presentation are used to summarize data. (Knapp-USGS)
W71-05869

GROUNDWATER RECONNAISSANCE OF THE GREEN RIVER BASIN, SOUTHWESTERN WYOMING,
Geological Survey, Washington, D.C.
George E. Welder.
For sale by U Geological Survey, Washington, DC 20242-price $1.00. Geological Survey Hydrologic Investigations Atlas HA-290, 3 sheets, 1968. Text, 6 fig, 5 map, 2 tab.

Descriptors: *Water resources, *Groundwater, *Maps, *Hydrologic data, *Wyoming, Geologic investigations, Surface waters, Geology, Aquifers, Aquifer characteristics, Water yield, Water quality, Water wells, Water levels, Chemical analysis, Streams, River basins, Springs, Groundwater recharge, Precipitation (Atmospheric), Hydrology, Data collections, Water sources, Seepage.
Identifiers: *Green River Basin (Wyoming), Hydrologic Atlas, Groundwater reconnaissance.

This report, consisting of a Hydrologic Atlas of 5 maps on 2 sheets and a separate text, describes the occurrence and quality of groundwater in the Green River structural basin of Wyoming. Some general information concerning surface water has been included because of the close relationship of groundwater to surface water in parts of the basin. The area consists of approximately 10,000 square miles, which is about 60% of the Wyoming part of the Green River drainage basin. The rocks that underlie the area range in age from Precambrian to Recent. Rocks at the surface are divided as follows: 82% of Tertiary and Quaternary age, 2% of Paleozoic and Mesozoic age, and 16% of Precambrian age. Recharge to groundwater reservoirs is mainly by seepage from precipitation and streams. Yields of most wells range from about 10 to 100 gpm. The quality of groundwater ranges from very poor to excellent with a range of dissolved solids from less than 500 to more than 3,500 ppm. The water in most of the perennial streams contains less than 500 ppm total dissolved solids. Two exceptions are the reaches of Big Sandy Creek below the Eden-Farson irrigation project and Blacks Fork below the Lyman irrigation project. Total dissolved solids in the surface water of these reaches generally exceed 1,500 ppm. (Woodard-USGS)

DISCUSSION OF THE USES OF ELECTRONIC PLOTTING IN GROUNDWATER ENGINEERING,
Johnson and Anderson, Inc., Pontiac, Mich.
G. E. Evans.
Paper, Johnson and Anderson, Inc, Pontiac, Mich, 1970. 19 p, 12 fig.

Descriptors: Computer programming, Engineering, *Computers, Mapping, Boreholes, Calculations, Logging (Recording), Profiles, Electronic equipment, *Civil engineering, Drawings, Abilities, Accuracy, Ideas, *Computer applications, Cost savings.
Identifiers: Computer-aided design, *Plotters, Time saving, Time sharing, Computer capability.

Computer-plotters and their application to civil engineering problems are discussed. Several examples show how laborious plotting and profiling of civil engineering work is speeded up and accuracy increased by using the computer-plotter. Some general statements are made concerning the use of computer-plotter programs for mapping, contouring, borehole logging, planning and profiling, and geologic sectioning. Experience indicates that good engineering programs are more likely to be written

by excellent engineers with reasonable programming skills, than by excellent programmers with engineering skills. (USBR)

INTERBASIN DIVERSION OF WATER: AN ANNOTATED BIBLIOGRAPHY,
Texas Tech Univ., Lubbock. Water Resources Center.
George A. Whetstone.
Water Resources Center Report WRC-71-1, Vol 2, January 1971. 323 p. Supported by Water, Inc and Texas Tech Water Resources Center.

Descriptors: *Bibliographies, *Inter-basin transfers, *Water resources development, Water supply, Water transfer, Diversion.

Future growth in the state of Texas will depend upon inter-basin water transfers into the state from other regions. This leads to a realization of the need for accumulating all inter-basin transfer literature into a central publication. This volume contains 1027 abstracts in a chronological arrangement (1855-1970) and extends and augments Vol. 1 (abstracted in this publication, W70-06816). The abstracting and indexing formats are identical, with author and geographic indexes. Every effort was made to prevent duplication in subject matter. Papers involving certain large-scale projects were not abstracted unless they contain new information. A third volume is in preparation. (See also W70-06816) (Casey-Arizona)

EXTRAPOLATION OF HISTORICAL STORM DATA FOR ESTIMATING DESIGN-WAVE HEIGHTS,
Chevron Oil Field Research Co., La Habra, Calif.
C. Petrauskas, and P. M. Aagaard.
Society of Petroleum Engineers Journal, Vol 11, No 1, p 23-37, March 1971. 15 p, 17 fig, 4 tab, 9 ref, 2 append

Descriptors: *Waves (Water), *Design storm, *Synthetic hydrology, Offshore platforms, Weather forecasting, Probability.
Identifiers: Wave height forecasting.

An improved method is presented for selecting offshore structure design waves by extrapolating historical storm data to obtain extreme value statistics. The method permits flexibility in choice of distribution functions through use of computerized procedures, estimates extrapolated wave-height uncertainty due to small sample size, and includes criteria for judging whether or not given wave-height values can be represented by one or more of the distributions implemented in the method. The relevance of uncertainty to selection of design-wave heights is discussed and illustrated. (Knapp-USGS)

FLOODS FROM SMALL DRAINAGE AREAS IN CALIFORNIA-A COMPILATION OF PEAK DATA OCTOBER 1958 TO SEPTEMBER 1969,
Geological Survey, Menlo Park, Calif., Water Resources Div.
Arvi O. Waananen.
Geological Survey Data Compilation Report, July 9, 1970. 146 p, 46 fig, 1 tab.

Descriptors: *Floods, *Small watersheds, *California, Data collections, Hydrologic data, Stream gages, Gaging stations, Stage-discharge relations, Surface waters, Discharge measurement, Hydrographs, Rain gages.
Identifiers: Flood data (Calif).

An investigation of the magnitude and frequency of floods from California drainage areas generally of less than about 10 square miles was begun by the Geological Survey July 1, 1958. The objective of the program is to obtain sufficient basic hydrologic data to define for such areas the magnitude and frequency of floods on a regional basis for the entire State, and to obtain sufficient flood-hydrograph data, on a statewide basis, for detailed hydrologic study. The report consists of a tabulation of the annual peak stage and discharge, by water years, for each gaging station in the program. The discharge hydrograph and recorded graph of accumulated rainfall for significant peak discharges during the current year are included for stations that are equipped with water-stage recorders. Monthly and annual rainfall totals are given for the recording stations. In addition, discharge hydrographs and precipitation graphs, as well as monthly and annual precipitation, published in previous annual reports, are repeated in this report to provide a complete record. Program activities during the current year and program plans for the following year are summarized briefly. (Woodard-USGS)

Geology, Aquifer characteristics, Water yiel
Water levels, Water wells, Investigations, Wat
quality, Hydrologic data, Data collections, Chem
cal analysis, Water resources, Evaluation, Map
Water level fluctuations, Groundwater movement
Identifiers: *Groundwater resources (Nelso
County, ND), *Hydrologic Atlas.

This investigation is part of a Statewide program
North Dakota to determine the location and exte
of the groundwater reservoirs (aquifers); to evalu
ate the occurrence and movement of groundwat
within these aquifers, including the sources o
recharge and discharge; and to determine th

hemical quality of the groundwater. Nelson County covers an area of approximately 1,000 square iles in northeastern North Dakota and is almost ntirely covered by glacial drift, which may be subivided into two distinct types. The most common ype, till, was mainly deposited by active glaciers, as a low permeability, and will normally yield only nall quantities of groundwater to wells. Glaciofluial deposits, the least common type, were eposited by moving water, are normally quite ermeable, and form the principal aquifers in Nelon County. The glacial till normally yields water ith greater dissolved solids than water produced om wells tapping glaciofluvial deposits. This 1-eet Hydrologic Atlas includes a Groundwater vailability map and 7 related tables and illustraons. (Woodard-USGS)

STATISTICAL SUMMARIES OF NEW JERSEY STREAMFLOW RECORDS,
Geological Survey, Trenton, N.J.
S. L. Laskowski.
New Jersey Division of Water Policy and Supply Water Resources Circular 23, 1970. 264 p, 3 fig, 21 ref.

Descriptors: *Streamflow, *Hydrologic data, *Data collections, *Gaging stations, *New Jersey, Discharge measurement, Surface waters, Flow rates, Low flow, Average flow, Peak discharge, Statistical methods, Duration curves.
Identifiers: Annual flow.

The records for 79 of approximately 110 streamgaging stations presently or previously operated in New Jersey, plus records for three stations in Pennsylvania, and one in New York are presented in summarized form. A description of the station, three arrangements of data summarizing the daily flow records and one table listing statistics of the monthly mean flows are provided. Plotting positions for the three types of curves describing the characteristics of daily discharge are listed for each station. Statistical parameters are also presented so that alternate curves may be drawn. All stations have 5 or more years of record. The data are based on observed flow past the gaging station. For any station where the observed flow is affected by regulation or diversion, a remarks paragraph, explaining the possible effect on the data, is included in the station description. (Woodard-USGS)

W71-05930

PROBLEMS IN DISPOSAL OF WAST HEAT FROM STEAM-ELECTRIC PLANTS.
Federal Power Commission, Washington, D.C. Bureau of Power.

1969. 53 p, 11 fig, 4 tab, 39 ref.

Descriptors: *Thermal pollution, *Thermal powerplants, *Cooling water, *Cooling towers, *Aquatic environment, Environmental engineering, Fish physiology, Fish farming, Electric power demand, Environmental effects, Water temperature, Thermal power, Discharge, Ohio River.
Identifiers: *Waste heat disposal, Steam-electric plants, Heat disposal.

This report, prepared by the staff of the Bureau of Power, was prepared as part of the Commission's updating of the 1964 National Power Survey. The report explains the problems and conventional means of waste heat disposal from both fossil fueled and nuclear steam-electric plants in the conterminous United States. The methods of waste heat disposal discussed include once-through cooling, wet tower, dry tower, and evaporative pond cooling. The effects of thermal discharges on streams and water uses and water quality standards are discussed. The aesthetics and environmental concerns are mentioned. Estimates of power requirements and cooling water requirements, together with potential sources of cooling water supplies, are discussed. The capacity of the Ohio River to supply required water quantities is analyzed. A summary of completed and current studies of waste heat disposal problems is included together with statements regarding specific research needs. Comparative investment costs of cooling water systems are given. About 492 plants will be required by 1990, of which about 255 would be new sites. The total generating capacity requirements will be about 1 million megawatts. The significance of water temperature as it affects the physiology of fish is discussed. (Poertner)
W71-05931

FACTORS IN WASTE HEAT DISPOSAL ASSOCIATED WITH POWER GENERATION,
Federal Power Commission, Washington, D.C.
Robert M. Jimeson, and George G. Adkins.
Paper No 26a presented at 68th National Meeting of American Inst of Chemical Engrs, Houston, Feb 28-March 4, 1971. American Institute of Chemical Engineers, New York, 1971. 41 p, 8 fig, 4 tab.

Descriptors: *Thermal powerplants, *Cooling towers, *Environmental effects, *Thermal pollution, *Cooling water, Electric power demand, Water temperature, Thermal power, Environmental engineering, Electric power production, Discharge.
Identifiers: *Waste heat disposal, Steam-electric plants, Heat disposal.

Energy requirements from fossil fueled and nuclear steam generating plants, together with associated waste heat, are projected for the year 1980 and 1990. Ecological effects and beneficial uses of waste heat are stated. The trend in thermal standards for natural water bodies is discussed. The characteristics of various cooling methods for disposing of waste heat at steam-electric powerplants are presented along with their cost and effectiveness. The study concludes that the demand for electric power will increase fourfold by 1990. As

any as 140 and possibly as many as 200 new plants will require cooling towers, and from 50 to 130 new plants may require cooling ponds by the year 1990. The cost to the power industry for control of the water environment is estimated to range from $1.3 to $2 billion per year, and the industry must raise an additional 6 to 9 billion dollars in the capital market in the next twenty years to achieve control of thermal pollution. Much research leading to improved environmental controls is yet needed. Also, additional emphasis should be placed on research leading to more efficient power generation, since successful development would have a major impact on reducing environmental degradation. (Poertner)
W71-05932

MASTER PLAN FOR THE DEVELOPMENT OF WATER DISTRIBUTION FACILITIES FOR GENESEE COUNTY, ENGINEERING REPORT.
Consoer, Townsend and Associates, Flint, Mich.

Genesee County Drain Commissioner, Flint, Michigan, 1969. 96 p, 32 fig, 10 tab. Project No P-Mich-3230; US Dept of Housing and Urban Development.

Descriptors: *Water supply, *Water conveyance, *Water distribution, *Planning, *Water resources development, *Municipal water, Cities, Urbanization, Water delivery, Pumping, Demand, Consumptive use, Hydraulic engineering, Michigan.
Identifiers: *Genesee County, *Flint.

The initial or first phase of the Genesee County water supply system, as proposed in this report, would consist of a pumping station, two 4.0 million gallon capacity standpipes constructed along Vassar Road near Potter Road, trunk distribution mains and a 2.0 million gallon capacity elevated tank located near Grand Blanc and Porter Roads. The water for the County system would be obtained through two 18 inch diameter metered connections to an existing 72 inch main at Vassar Road. The water would flow from the metered connections into two 4.0 million gallon standpipes, from which it would be pumped by the Vassar Road pumping station facilities into the proposed supply system. The first phase of construction would cost an estimated $16,800,000. The second phase would consist of a second pumping station with adjacent 20.0 million gallon ground storage reservoir at Oak and Potter Roads together with additional 36 inch diameter transmission mains. The second phase would cost an estimated $12,600,000. The third phase expansion would include a 20.0 mgd capacity pumping station and 10 million gallon capacity reservoir to be constructed near Elms Road and Stanley Road. This pumping station and related distribution system piping would cost an estimated $5,400,000. The construction and project costs for these three phases of the water system are based upon present-day costs and are related to the present Engineering News-Record Construction Cost Index of 1229. The consultants suggest that project construction costs be financed by the various governmental units served in accordance with estimated benefits. (See also W71-05934) (Poertner)

SNOW LOADS FOR THE DESIGN OF ROOFS IN CANADA,
National Research Council of Canada (Ottawa) Div of Building Research.
D A Lutes.
Proceedings 38th Annual Meeting of Western Snow Conference, April 21-23, 1970, Victoria, British Columbia, Canada: Printed by Colorado State Univ, Fort Collins, p 61-67, 1970. 7 p, 5 fig, 6 ref

Descriptors: *Snowpacks, *Density, *Loads (Forces), Ice loads, Load distribution, Weight, Design, Design criteria, Building codes, Snow surveys, Data collections, Sampling, Topography, Altitude.
Identifiers: *Snow loads, *Canada

A more rational approach to snow loads for the design of roofs in the National Building Code of Canada has resulted from a ten-year country-wide survey of actual snow loads on roofs. The objective of the survey was twofold: to determine by how much average roof loads can be reduced below the level of ground loads; and to assess factors that result in the accumulation of higher loads on particular areas of various shapes of roofs from the effects of wind, sliding, etc. This paper describes the factors that affect snow loads, the survey and its results, and the present requirements for snow loads for the design of roofs in Canada. INSTALLATION OF SOIL, WASTE AND DRAINAGE PIPING IN FILL OR UNSTABLE SOIL,
T. Cecil Brown.
Water Sewage Works -- Reference Number, p R-47 to R-50, Nov. 28, 1969.

Descriptors: *Installation, *Sewers, *Drainage engineering, *Costs, Subsurface runoff, Infiltration.

Drainage lines, which can be sanitary, storm or combined sewers, should be well designed and constructed, properly supervised during construction, and closely inspected. Recommendations are made in this article to facilitate compliance with these objectives. Sewer installation is described in terms of considerations to be made regarding the filled area. Cost criteria are also discussed. Economy is not always limited to the selection of the least expensive materials because cheaper material may prove to be the most expensive to the taxpayer in the long run. Infiltration and joint failure are treated briefly with recommendations for tight joints and for the prevention of stormwater entrance into sanitary sewers.

LOW-PRESSURE AIR TESTS FOR SE LINES,
W. J. Malcolm.
Am City, Vol 84, No 11, p 74-75, Nov 1969. 2

Descriptors: *Testing, *Sewers, *Infiltra Leakage.
Identifiers: *Sewer lines, *Air-testing.

New waste water lines can be tested for leaka exfiltration either by the common method of pressure or by low-pressure air, a method be ing more popular. Such testing is imperative si there is no exfiltration, neither will there be inf tion. A tight sewer line lowers the volume flo into lines and treatment plants, thus, pumping treatment costs are lowered, and less floodin curs. The author presents eight frequently-a questions concerning air testing, and he ans the questions briefly.

INTERNATIONAL BUILDING EXHIBITION - OLYMPIA LONDON 13-25 NOVEMBER 1969.

Surveyor, Vol 84, No 4039, p 54, 74, 77, Nov 7, 1969. 3 fig.

Descriptors: *Plastic pipes, *Rain gages, *Design criteria, *Construction materials, *Underground structures, Flow rates, Drainage systems, Equipment, Plastics.
Identifiers: *Great Britain.

This article reviews exhibitions of products, equipment, materials, and techniques at the International Building Exhibition at Olympia, London. A new square-line instead of round rainwater gutter system of plastic was displayed, in addition to a squareflow rainwater gage. Both have greater flow capacity than their traditional counterparts. A new drainage system exhibited has the following features: simplicity of layout and specification, push jointing of pipes, fittings, and plumbing connections, and fast laying speed. A domestic underground stormwater drain using plastic Polydrain PVC pipe was demonstrated; this material is now being employed extensively for underground drainage systems.
W71-06348

SUSPENDED SEWAGE PIPELINE.

Water Waste Treat, Vol 12, No 8, p 256, Jul/Aug 1969.

Descriptors: *Construction equipment, *Installation, *Pipelines.
Identifiers: *Great Britain, *Suspended pipeline.

By the use of Hepworth-Polva pvc pipe with flexible couplings, a 12-inch diameter sewage pumping main has been suspended from a bridge (which crosses the River Tay) on fabricated metal brackets which allow for pipe movement arising from thermal expansion and contraction of the pipeline. The method of suspension allows for leveling, and the completed pipeline has an insulating wrapping. The installation also has advantages over traditional materials in that the pipeline is light in weight, immune to corrosion, and requires no maintenance.

DRAINAGE OF WIDE ROAD PAVEMENTS,
K. W. Dobinson.
Inst Engrs (Australia), Vol CE 10, No 1, p 1-6, Apr 1968.

Descriptors: Surface drainage, Design, Drainage engineering, Drainage systems.

The effectiveness of various types of pavement drainage structures is discussed. The surface drainage design method, used under certain conditions, is described. A graphic system for the design of pavement drainage is examined.

MORE THAN JUST A BUILDING,
L. C. Dubs.
Am City, Vol 85, No 6, p 119-124, June 1970.

Descriptors: *Drainage systems, Construction, Overflow, Ohio.
Identifiers: *Dry wells.

A three-phase program designed to place all the city's service functions in one area is underway in Canton, Ohio. The first phase involves the construction of two buildings; one a motor vehicle service center, and the other a street and sewer department. The service center's unusual drainage system consists of a system of dry wells constructed throughout the area with one large dry well absorbing overflow from the smaller ones. This system was adopted because storm sewers were not available in the region. Only minor flooding occurred once when there was a heavy rainfall, so the effectiveness of this system was evidenced.
W71-06369

A NEW TWIST (90 DEGREES IN FACT) TO SEGMENTED SEWER - PIPE DESIGN.

Eng Contract Record, Vol 83, No 6, p 56-57, Jun 1970.

Descriptors: *Sewers, *Design, *Estimated costs, Installation.
Identifiers: *Canada, *Sewer hydraulics.

The City of Edmonton, Canada, is using a new segmented pipe on the sewer line in the downtown area. Chief design engineer F. Bereczky thought of tilting a horizontal sewer line to a 90 degree position, thus changing the flow characteristics. The design of the pipe has been worked out so that all dimensions are a function of the inside diameter, and the design can be adopted to any size of pipe. The installation procedure and the estimated cost of the new line are given.

WATER STORAGE METHODS -- FROM CUPPED HANDS TO COMPUTERS,
T. W. Lumsden.
Water Pollution Control, Vol 107, No 6, p 16-19, and 30, Jun 1969.

Descriptors: *Reservoir storage, Construction costs, Storm drains, Storm runoff.
Identifiers: *Stormwater systems.

Storage tanks and reservoirs should provide for flow equalizing, fire protection, and emergencies. An overall system analysis is usually necessary to determine the most economical combination of storage facility, trunk mains, and pumping facility. Criteria for locations of storage facilities and construction cost considerations are noted in this article. Stormwater systems exhaust sizable segments of expenditures utilized for water storage in general. Drains must provide for normal stormwater runoff and higher flows resulting from reservoir emptying and inadvertent overflows.
W71-06385

SOLUTION OF AN UNUSUAL SUBSURFACE DRAINAGE PROBLEM,
E. W. Brand.
J Irrigation Drainage Div, Am Soc Civil Engrs, Vol 94, No IR2, p 199-221, Jun 1968.

Descriptors: *Subsurface drains, *Surface-groundwater relationships, Design, Storm runoff.
Identifiers: *Surface runoff, Groundwater, Belgium.

The stages followed in designing a subsurface drainage system for the inner-ring road being built in Antwerp, Belgium are described. The system will collect and carry away surface runoff, will permanently lower the groundwater table, and will collect and carry away seepage water resulting from this lowering. Conventional methods were adopted for stormwater drainage design. The seepage water and stormwater collected in a catch basin will run by gravity in pipes to one of four low points in the road's vertical profile. From two of these points the water will flow to pumping stations and from the other two, into rivers. The most complicating factor in the subsurface drainage design was the possible effect of the precipitation of ferric oxide from groundwater. This factor necessitated complete submergence of the intake system. Factors influencing the final selection of the subsurface drainage system are explored in detail.

SOME THOUGHTS ON SEWER PIPE BEDDING,
William J. Warwick.
Water Pollution Control, Vol 107, No 8, p 30-31, Aug 1969.

Descriptors: *Pipelines, Design criteria, Installation.
Identifiers: *Sewer pipe bedding.

Important aspects of sewer pipe bedding are explored in the areas of: satisfactory bedding needs, economics of installation, special cases, enforcement of design criteria, and performance. Technical information is lacking concerning the special case of common or separate trenches for side-by-side storm and sanitary sewers or sewer connections. Usually two such pipes are laid in a common trench, but the economics and functional usages may not always warrant this choice. More study is needed to determine the advantages or disadvantages of dual trenches.
W71-06412

NEW IDEAS FOR CALCULATING STORM WATER OVERFLOW SETTINGS AND THE DESIGN OF STORM WATER TANKS.

Civil Eng Public Works Rev, Vol 65, No 766, p 487, May 1970.

Descriptors: *Storm runoff, *Overflow, *Design.
Identifiers: *Storm overflows, Storm tank.

The Technical Committee on Storm Overflows devised a new formula for setting storm overflows which enables them to be designed without first conducting infiltration surveys. The report of this committee also condemns the use of low-side weir storm overflows because they cause excessive pollution. Ideas for the use of storm tanks during periods when they are not required for their design purposes are proposed. The question of flow standard storm tank effluent discharged at the same time as high-quality standard effluent is presented but not answered in this report.

MAIN DRAINAGE,
T. A. Anderson.
Surveyor, Vol 83, No 4010, p 92-94, Apr 18, 1969. 6 fig.

Descriptors: *Sewers, *Construction, Tunneling, Geomorphology, Installation, Legal aspects.
Identifiers: *Construction problems, *Sewer construction, *Scotland.

The author describes several sewer jobs he undertook as a Resident Engineer in the Glasgow Office of Public Works. One job entailed the construction of a two-mile main duplicate sewer in Rutherglen. Problems arising due to encounters with varying types of ground are related and measures taken explained. As a result of high pressure, escapes of air (blow-outs) occurred on a nearby railway line. Tunneling was halted until a tunnel shield was installed which helped complete the job. Other construction problems relating to sewer jobs are discussed. Interference with Glasgow parking areas due to sewer construction was solved through the institution of a program of conversion of open spaces to off-street car parks. In conclusion, the author recommends the establishment of regional sewerage authorities similar in organization to Scotland's Water Board, plus the formation of drainage boundaries on a topographical rather than a parochial basis.

FLAT-VEE WEIRS IN ALLUVIAL CHANNELS,
Hydraulics Research Station, Wallingford (England).
William Rodney White.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY3, Paper 7989, p 395-408, March 1971. 14 p, 11 fig, 2 ref.

Descriptors: *Weirs, *Alluvial channels, *Channel morphology, *Stage-discharge relations, *Hydraulic models, Model studies, Sediment transport, Hydraulic similitude, Sedimentary structures, Bed load, Alluvium, Gaging stations, Stream gages.
Identifiers: Flat-vee weirs.

Sediment tests were carried out with the ultimate aim of providing design data for flat-vee weir installations in alluvial channels. The model study was of an idealized nature but did serve to indicate those variables which are important and the type of conditions where shoaling in the approach channel is likely to occur. Correlation with initial movement theory was established and the results were used to predict prototype bed formations in terms of sediment properties and flow conditions. The mean angle at which the water surface line contracted was one on three. The breadth of channel between the side shoals immediately upstream of the weir crest line was, in each case, 1.1 m while the water surface breadth at the crest was approximately 1.0 m. This means that near the crest line the shoals extended into the river almost to the point where water was just spilling over the crest line. (Knapp-USGS)

EFFICIENCY OF HYDRAULIC JUMP,
Uttar Pradesh Irrigation Research Inst., Roorkee (India).
Satya P. Garg, and Hari R. Sharma.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY3, Paper 7994, p 409-420, March 1971. 12 p, 6 fig, 3 tab, 11 ref.

Descriptors: *Hydraulic jump, *Stilling basins, *Energy dissipation, Head loss, Hydraulic structures, Flow, Open channel flow, Hydraulics, Critical flow, Drops (Structures), Froude number.
Identifiers: Efficiency (Hydraulic jump).

The existing definitions of the efficiency of hydr lic jump may not furnish a correct picture of physical phenomenon. A more rational definit of the efficiency of hydraulic jump on a horizo floor in a rectangular channel is given by the r of the energy actually dissipated in the jump to required to be dissipated. The jump efficiency creases rapidly with increasing Froude number it becomes asymptotic to the 100% line at a Fro number of about 4. The scouring energy of the f downstream of the jump also decreases with creasing Froude number. Experimental data h been presented which show that scour be hydraulic structures provided with jump-t stilling basins in which the Froude number of incoming flow is less than 4.5 can be reduced c siderably by the provision of floor blocks. new approach based on the transfer matrix
ethod used in the theory of vibrations is
esented to study steady-oscillatory flows, and to
termine resonating characteristics of pressure
nduits. By linearizing the friction loss term, con-
dering the system as distributed, and assuming
scharge and pressure head fluctuations as
nusoidal, field matrices for simple pipelines and
rallel systems are derived. Point matrices for ori-
es and for oscillating valves having sinusoidal
lve movement are obtained by linearizing the
te equation. Point transfer matrices for branch
stems with the side branch having different boun-
ry conditions are also developed. A procedure is
tlined to determine the resonant frequencies of
stem types commonly used in waterpower
velopment and water supply schemes. Validity of
e method is demonstrated by comparing results
th experimental values and with values obtained
the method of characteristics. (USBR)

llowing the San Dimas Canyon (Johnstone
ak) Fire of 1960, the United States Forest Ser-
e established a comprehensive research project
h the Experimental Forest, one phase of which
s to obtain and evaluate hydrologic data relative
runoff and debris movement from burned
tersheds. A preliminary step undertaken in this
ject of the research project was the construction
installation of 36 flumes of trapezoidal section
selected watersheds ranging between 2 and 101
es in size. On the basis of observations made
ing storm runoff periods and analysis of
drologic data obtained during the 1961-1962
rm season, the Forest Service concluded that
draulic model tests of field installations should
undertaken. In view of the value of hydrologic
a from recently burned watersheds, the Los An-
es County Flood Control District joined with the
rest Service in conducting model flume tests.
e report describes the model study and presents
ng curves to relate flow rate and stage recorded
water level recorders. These rating curves are
ended for general application to all flumes where
ocity immediately upstream from the inlet is less
n critical velocity in the flume, and where the
ne, is free from effects from downstream flow
ge, but are considered only indicative where
v contains appreciable debris quantities. In ad-
on, criteria are presented for modification of
ne installations to effect a control at flume inlets
ere such control does not already exist.

PENETRATION IN A GRADED FILTER,
Missouri Univ., Rolla. Dept. of Civil Engineering.
William Chuan Shen.
M. Sc. Thesis, 1970. 91 p, 2 fig, 6 tab, 8 ref, append. OWRR Project A-028-MO (1).

Descriptors: *Filters, *Filtration, *Porous media, Sands, Seepage, Percolation, Hydraulic radius, Porosity, Pores, Interstices, Voids, Deposition (Sediments), Erosion control, Water level fluctuations.
Identifiers: *Filter clogging, *Graded filter beds.

An experimental laboratory study was conducted to examine clogging within and penetration of fines into a single layer graded filter. Hydraulic gradient, filter gradation and flow direction were varied. Forty one tests gave over 600 penetration depths. The magnitude of penetration in filters with considerable variation in gradation patterns correlated with an average hydraulic radius based on the volume of voids and an approximated total surface area. An increased thickness of poorly graded filter will stop penetration such as that caused by seepage erosion. A relationship between hydraulic radius, penetration depth and probability of penetration is presented. (Knapp-USGS)

THE LE ACOUSTIC FLOWMETER - AN APPLICATION TO DISCHARGE MEASUREMENT,
C. R. Hastings.
J Water Works Assoc, Vol 84, No 2, p 127-151, Jun 1970.

Descriptors: *Flowmeters, *Discharge measurement, *Hydraulics, *Instrumentation, Testing.

A variety of discharge measurement devices have been invented of which a flow measuring system using the LE Flowmeter is the most recent system to substantially advance the art. The concept employed is an application of numerical integration by Gaussian Quadrature. Test results under varying conditions of fully developed and distorted flow show that this measurement system has an rms accuracy better than 1.0 percent. Use of the LE Acoustic Flowmeter give this flow measuring system features not possessed by other devices, such as linearity, bidirectionality, no head loss, and not need for calibration.

CHARACTERIZATION AND CONTROL OF COMBINED SEWER OVERFLOWS, SAN FRANCISCO,
D. W. Eckhoff, A. O. Friedland, and H. F. Ludwig.
Water Res, Vol 3, No 7, p 531-543, 1969.

Descriptors: *Overflow, Outlets, *Analytical techniques, Runoff, Sewage treatment.
Identifiers: *San Francisco, *Storm sewage.

In order to find methods for controlling or treating storm-sewage overflows from combined systems in urban areas, overflows from the combined sewerage system of San Francisco were measured and sampled for analysis at two outfalls in the city. The dry-weather flows were also monitored. From the data obtained and other observations, the annual runoff for the whole of the city was compared with its total annual discharge of treated sewage effluent, and the effects of the dry-weather flow on the overflow and of the overflow on receiving waters were investigated. The latter effect produced a considerable increase in the numbers of coliform bacteria which remained higher than normal for about two weeks. The studies showed that treatment of overflows from combined systems could result in a substantial reduction of pollution at less expense than would be involved in separating the systems, and that dissolved - air flotation with chlorination appeared to be a promising method.

OVERFLOW STUDIES AT A SEWER SYSTEM OF A METROPOLITAN CITY,
Wilhelm v.d. Emde, and Siegfried Hoffman.
Gas Wasserfach (GAWFAN), Vol 110, No 12, p 321-325, Mar 1969. 4 ref.

Descriptors: *Sewers, *Measurement, *Storm runoff, *Overflow, *Parametric hydrology, *Rainfall, *Mathematical studies.
Identifiers: *Capacity, *Germany.

For determining the capacity of the sewer system including stormwater drainage in Hamburg, the flow speed, the water level, and the sludge deposition during dry weather were measured. The speed is found to be approximately 0.5m/sec, and sludge deposition is hardly avoidable at the low inclination of the canal system. The conditions during rainy weather were determined with automatic level recording units. From these level measurements the frequency of overflow in days/year, the overflow duration in hours/year, and the overflow quantity/year were calculated. From the recordings of rainfall and the level measurements at the overflow

spills of the sewer system a diagram is drawn according to Kuipers' equation providing information on the storage capacity and discharge capacity of the overflow spills. These two parameters determine the critical rainfall for the overflow spill. Its magnitude decreases with increasing duration of rain and asymptotically approaches the discharge capacity. To avoid frequent overflow, calculations should be based on the critical rainfall as a function of the overflow time. Since this is not practical, it is recommended to use the normal rainfall for the calculation and multiply the quantities obtained by a constant factor.

METHOD OF AND MEANS FOR DEALING WITH STORM-WATER OVERFLOWS IN SEWERS AND LIKE DRAINAGE SYSTEMS,
F. Wood.
Brit Patent 1,023,311.

Descriptors: *Overflow, *Drainage systems, *Bays, *Treatment facilities, Sewerage, Screens, Outlets.
Identifiers: *Storm sewage, *Storm overflows.

The equipment examined for dealing with storm-sewage overflows in sewerage and other drainage systems comprises a bay fitted with a trough or channel which has walls of unequal height and a mouth covered with a filter screen, which can be cleaned by a rake or rakes rotating in the direction of flow of water through the bay. Under normal conditions of flow, water passes through the bay directly to the sewer, but under storm conditions, the increased flow causes a build-up of pressure in the bay so that water and floating trash flows over the lower wall of the trough and through the screen to the storm-sewage outlet. Trash is swept from the screen by the rake (s) over the higher wall into a trash pit and thence to the sewer.

VELOCITY MEASUREMENTS IN SEWERS VITAL TO DESIGN AND MAINTENANCE,
Lamont W. Curtis.
Water Sewage Works, Vol 116, No 4, p 144-147, Apr 1969. 2 diag, 2 tab, 2 graphs, 1 ref.

Descriptors: *Flow measurement, *Sewers, *Analysis, *Methodology, *Velocity, Mannings equation.
Identifiers: *Sewer hydraulics.

Discharges can be converted to waste water volumes per capita in a sanitary sewer, or can be related to rainfall in a storm sewer. The velocity, depth, and slopes measured can be used to compute Manning's coeficient of the roughness-friction factor. The salt-concentration method of measuring velocity was best suited for developing a discharge-depth relationship for a number of sewers, as well as giving an indication of the condition of the sewer. The equation applicable for the salt-concentration method is Q — AV, where: Q is the discharge; A is the area, computed from the measurement of the flow depth; and, V is the velocity measurement. The equipment needed, procedure, analyses of data, and continuous gaging methods are discussed in detail. It is concluded that there is no ratio, which when applied to surface velocity measurements, will give accurate average velocities in a pipe. Results of the studies indicate, however, that a ratio of .75 will give a good approximation for flow depths between .2 and .4 of the pipe diameter.

RBULENT FRICTION IN ECCENTRIC AN-LAR CONDUITS,
es M. Robertson.
CE Combined Sewer Separation Project, Univ llinois, T and AM Report No 310, Mar 1968. 13 3 tab, 48 ref. FWPCA Program No 11020 EKO.

criptors: *Flow around objects, *Head loss, essure conduits, Data collections, Flow rates. ntifiers: *Annular pipes, *Hangers, Eccentrici-Sew-in-sewers.

owing a general review of the analytical and ex-mental information on the friction loss encoun-d by fluids flowing in annular pipes, with par-lar regard to the influence of eccentricity of the r member, experiments are described on an uation of the friction of water in a steel annular of diameter ratios 5.8 and 3.2 in the Reynolds ber range of ten to the fifth power to ten to the power. It is found that on a discharge basis, he same head loss in a given length, with the eter ratio of 5.8 the flow capacity of the pipe is decreased 12.7% in the concentric situation only 4.5% with full eccentricity. The latter ease is not greatly different from the 3% reduc-in area due to the inserted smaller pipe. An ysis is included showing that for the simple in-at full eccentricity the near-full-flow capacity sewer is little affected. The effects of hangers as might be employed to support inserts in rs is found to have an appreciable effect on the capacity of a full-flowing sewer.

ERIMENTAL ESTIMATION OF DETEN-N IN STORM SEWER SYSTEM,
eishi, and A. Katsuya.
s Japan Soc Civ Engrs, Vol 151, p 47-57, Mar .

riptors: *Storm runoff, *Capacity, Sewer ulics.
ifiers: *Storm sewers, *Capacity, Sewer ulics.

lts of an experimental study on storm runoff in ban area showed that the phenomena called as detention, retardation, storage and flooding hydraulically identical phenomena. These ex-ents were made for sewer slopes of 1/200 and 0. The control structures had negative effects e capacity of dynamic storage except when ng in the lower area was concerned or when rainage pump capacity was designed to be ssed. Flooding does not always occur by in-ng the return period, because the maximum f runoff becomes a steady state when calcu-by the rational method.

LONG-TIME DRAINAGE PROBLEM IS ELIMINATED,
Alfred R. Pagan.
Public Works, Vol 100, No 6, p 98-99, Jun 1969.

Descriptors: *Drainage engineering, Design storm, Hydraulics, New Jersey.
Identifiers: *Pipelines.

The manner in which Demarest, New Jersey solved its drainage problem is discussed. The pipe line has a flow velocity during the design storm of less than 9 feet per second. Calculations indicate that the pipe provides an additional margin of capacity for even greater storms. Costs, contractors, and unforeseen complications are discussed.

DEVELOPMENTS IN SEWER MONITORING EQUIPMENT AND TECHNIQUES,
R. Galliers, and M. V. King.
J. Inst Munic Engrs, Vol 97, p 27-31, Jan 1970.

Descriptors: *Instrumentation, *Storm runoff, Sewers.
Identifiers: Sewer hydraulics, Birmingham, Alabama.

This paper describes equipment and techniques developed over the last five years by the City of Birmingham Public Works Department concerning flow in sewers. These methods can be applied to the control of trade effluent discharge, the design of sewers and river channels, and to the solution of drainage problems brought on by sewer flows such as storm overflows on rivers. Automatic equipment only was used to study storm flows since waiting for storm is not feasible. Automatic depth recording of rivers will soon be undertaken to obtain unit hydrographs for intense storms. This is the best method of designing natural catchments. Included are labeled diagrams of equipment used such as the streamline pressure head and recorder for depths of flow and various sampling machines used for qualitative tests on samples taken at known times.

TRANSMISSION IN THE 70'S,
Westinghouse Electric Corp., East Pittsburgh, Pa.
R. F. Lawrence.
Westinghouse Eng, Vol 30, No 6, p 180-184, Nov 1970. 5 p, 11 fig, 2 tab, 2 ref.

Descriptors: *Transmission (Electrical), Transmission lines, *Power interchange, Power loads, *Ultra high voltage, Right-of-way, Planning, *Extra high voltage, Reliability, *Interconnected systems, Power system operations, Power system stability, Forecasting, Direct current, Decision making, Underground transmission lines.
Identifiers: Transmission capacity.

Decisions made in the 1970's about kinds and voltage levels of power transmission will establish the patterns for several decades. Surveys and industry reports show no plans for transmission voltage levels above 765 kv. Installation of larger-size generating units will require more and stronger transmission interconnections. The interconnections will require rights-of-way across the countryside and in urban areas that will be more difficult to obtain. Transmission voltages above EHV levels must be seriously considered for best use of rights-of-way and for improvement in power system reliability. Now is not too early to think about building transmission lines for operation at higher UHV voltages in the future. (USBR)
W71-05912

INITIAL EXPERIENCES ON THE 765 KV SYSTEM OF THE AMERICAN ELECTRIC POWER COMPANY (USA),
American Electric Power Service Corp., New York.
H. C. Barnes, and V. Caleca.
Int Conf Large High Tension Elec Syst, Paris, France, Aug-Sept 1970, CIGRE 31-06. 13 p, 16 fig.

Descriptors: *Extra high voltage, Transmission lines, *Test results, *Transmission (Electrical), *Experimental data, Switching surges, Radio interference, Overvoltage, Reliability, Instrumentation, Field tests, Ultra high voltage, Accuracy, Electric power.
Identifiers: Test transmission lines.

159 switching operations and other tests were made on the first 765-kv line and stations placed in service in the USA by the American Electric Power Company. A general description of the sytem is given. Extensive data were obtained and compared with design data in the areas of switching surge overvoltage generation under varied conditions, methods for limiting overvoltages, characteristics of equipment, and radio interference and audible noise. One conclusion is that accurate modeling of magnetic circuits, characteristics of nontransposed lines, and loading factors are required if transient network analyzers are to predict performance with reasonable accuracy; otherwise, results are pessimistic. Results of the initial analysis of collected data are presented. (USBR)
W71-05913

A STUDY OF THE DESIGN PARAMETERS OF UHV LINES,
J. Clade.
Int Conf Large High Tension Elec Syst, Paris, France, Aug-Sept 1970, CIGRE 31-05. 18 p, 10 fig, 6 tab, 9 ref, append.

Descriptors: Electric coronas, Overhead ground wire, Flashover, Ice loads, *Transmission lines, Transmission towers, Contamination, Radio interference, Switching, *Ultra high voltage, Wind pressure, Foreign research, *Design, Interconnected systems, Clearances, Electric corona losses, Electric conductors, Bundled conductors, Electrical faults, Ice.
Identifiers: France, Italy, Great Britain.

The prospects of using UHV lines and their potential functions in France, Italy, and the United Kingdom are reviewed. The main parameters of the 765-kv lines and the reasons and methods adopted for their selection are described. These include conductor specification, switching-impulse level for conductor/tower and conductor/ground clearances, radio interference levels, and pollution requirements of the V-string support insulation selected. Results are included of laboratory studies of impulse and power-frequency flashover and radio interference performance of V-strings and of power-arc performance of the fittings. Overhead ground wire specification and installation are studied with respect to fault-current rating and Joule losses, and a scheme for partially insulated construction is described. The mechanical requirements of the tower design with respect to wind and ice loading are given particular attention. Some common rules for loadings are prescribed and comparisons made between towers designed by each of the 3 countries to these rules and to existing national regulations. (USBR)
W71-05914

SCAPER PRODUCTION SPEEDS PIPE TRENCHING AT LOWER COSTS,
William Donnely.
Construct Methods Equip, Vol 51, No 8, p 38-41, Aug 1969.

Descriptors: *Trenches, *Excavation, *Backfill, *Construction equipment, Comparative costs, Comparative productivity, Linings.
Identifiers: *Scraper.

Extra-wide slots for pipes were opened by scrapers thus adding width that provides operating room for direct machine excavating and backfilling and eliminates any hand shoveling. With this method, the scrapers complete the trenching and backfilling

50% faster with an overall saving of some 20% in total labor costs. Before pipes are placed the trench receives a 2-inch layer of leveling sand followed by a plywood screed creating a contoured bed in the sand for the pipe. A detailed description of the equipment used in the trenching is included.

GRAND COULE THIRD POWERPLANT NOISE CONTROL STUDY,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
T. H. Logan, R. H. Auerbach, C. C. Hutton, and G. J. Serpa.
Available from NTIS as PB-195 714, $3.00 in paper copy, $0.95 in microfiche. Report No REC-OCE-70-49, October 1970. 18 p, 13 fig, 4 tab, 26 ref.
Identifiers: *Noise, *Noise reduction, Sound, Sound waves, Barriers, Turbines, Environmental effects, Environmental tests, Acoustic equipment, Acoustic insulation, Acoustics, Hazards, Measuring instruments, Analysis, Hydroelectric plants, Field tests, Vibrations, *Grand Coulee Powerplant, Wash, Sound dampers, Acoustic energy, Health protection, Operating personnel, Visitor centers.

Grand Coulee Third Powerplant was recognized as a potential source of undesirable noise. Of major concern were noise levels in the residential areas produced by the transformers, exposure of O and M personnel to high noise levels inside the powerplant, and exposure of visitors to high noise levels in the turbine pits and on a crossover bridge above the transformers. Procedures, equipment, noise level measurements made, and method of analysis used to study the problem are presented. Conclusions are: (1) lowering the transformer noise level specification from 89 to 80 dBA, coupled with the barrier effect of the powerplant superstructure and normal attenuation with distance will prevent any appreciable rise of noise level in the residential areas; (2) since the Third Powerplant will be operated remotely, O and M personnel will spend only short periods of time in the noisier parts of the plant, and hearing protectors can be used most effectively; (3) reduced transformer noise levels, coupled with the barrier effect of the bridge structure, will result in acceptable noise levels on the crossover bridge; and (4) noise barriers are necessary in the turbine pits to protect visitors from discomfort and difficulty in conversing.

TRENCHER AND BOX SHIELD MAKE SEWER JOB ALMOST ONE-RIG OPERATION.

Construct Methods Equip, Vol 51, No 4, p 134-135, 138-140 and 143, Apr 1969. 8 fig.

Descriptors: *Excavation, *Construction equipment, *Cost analysis.
Identifiers: *Hydraulic trencher, *Storm sewers, *Guidance system, Oakland, Michigan, Laser beam.

A tractor-powered hydraulic trencher used a three-line bucket arrangement to perform digging for a 43,000-foot storm sewer in Oakland, Michigan. A box shield moved ahead 28 inches at a time and carried a hopper to distribute gravel for the pipe bed. Job difficulties held cost savings to about 10% below conventional backhoeing, but the trencher did protect against cave-ins in addition to providing safety in opening a trench parallel to gas and water lines. The trencher had three basic components: (1) a standard Cat D9 up front; (2) a ladder type bucket line and transverse unloading conveyer; and (3) a hydraulically powered telescoping box that slid along two sled type runners. Dimensions of each part are given along with details of the workings and operation of the trencher and its parts. Loading of spoils to trucks is described. Two guidance systems are mentioned; one which used a survey string line, and the other which employed an Acme laser gun

TOOLS OF THE BUILDER.

Construct Methods Equip Vol 51, No 2, p 164-168, 170-172, 174-175, 177-178, 180, 183-184, 186, Feb 1969. 15 fig.

Descriptors: *Construction equipment, *Tunneling machines, *Tunneling, *Hydraulic equipment, Tunnel construction, Piping, Control systems, Concrete construction, Electronic equipment.
Identifiers: *Mole, Laser beam.

This article explores advances made since 1963 in equipment used by contractors in non-highway construction. Means for handling, lifting, and moving materials grew steadily in size and power. Conventional-type equipment--cranes, derricks, conveyors, and pumps, became taller, stronger, and more versatile. Earth and rock boring for tunnel construction became easier with the development of machines able to tackle any type of geological formation. Special rigs are described which place large-diameter piping inside long tunnels. Advances in mole tunneling are cited. Hydraulic pumps, driven by electric motors, provide rotation, twist, and up-and-down actions of the boom and bucket, and they also propel the machine. Construction crews use laser beams as constant reference lines. They are visible day and night for long distances and are weak enough to be harmless. Future tunneling may be accomplished by rapid melting of rock with lasers or electron beams. New innovations discussed include: hydraulic-boom cranes, hydraulic fork lifts to handle heavy wall and slab forms, lightweight plastic-foam materials, concrete pumps, electronic computers, and television.
W71-06335

LASER BEAM AND POWDER-ACTUATED TOOL SPEED PIPE LAYING.

Water Sewage Works, Vol 115, No 12, p 574-578, Dec 1968.

Descriptors: *Installation, *Construction equipment, *Application methods, Sewers.
Identifiers: *Laser beam, Laser kit.

A new laser beam-aligner system, which includes a powder-actuated fastening tool as basic hardware, is enabling contractors to complete sewage installations at least 35% faster and with virtually 100% accuracy. Basic kit and hardware can meet more than 95% of requirements for average storm and sanitary sewer contracting job. Laser kit is designed for application with precast manhole with concrete base, concrete base without precast manhole, or simple bottom-of-the-ditch installation without concrete base. It is accurate in uphill or downhill alignments.
W71-06354

TRENCHLESS PIPELAYING DEMONSTRATED.

Water Waste Treat, Vol 12, No 2, p 71, Jul/Aug 1968.

Descriptors: *Tunneling machines.
Identifiers: *Great Britain, *Badger Major.

The Badger Major, a trenchless pipelaying machine, has been designed to revolutionize the laying and ducting of plastic pipes, pvc pipes, and cables in all types of soil and climatic conditions for water supply, sewage, land drainage, etc. The Badger Major works on a trenchless principle, passing through the ground a narrow blade with specially designed expanders at its base to create a smooth tunnel for the pipe. The control of the machine is fully automated by the use of an infrared light beam and hydraulic systems engineering. The system gives a working range of 2000 feet; accuracies of plus or minus 1/2 inch vertically and plus or minus 3 inches laterally are achieved.

8D. Soil Mechanics

THE INFLUENCE OF STRAINS IN SO MECHANICS,
Cambridge Univ. (England).
K. H. Roscoe.
Geotech, Vol 20, No 2, p 129-170, June 1970. p, 36 fig, 1 tab, 56 ref.

Descriptors: Soil engineering, *Soil mechanics, properties, Soil tests, Stress, *Strain, Shear te Stress-strain curves, Foreign research, *Defor tion, *Soils, Displacements, Bibliograph Behavior, Retaining walls, Foundations, *Mo tests, Loads (Forces), Soil pressure, Stress distri tion, Soil classifications, Test equipment.
Identifiers: Soil-structure interaction, Stress pa *Rankine Lectures, Coulomb-Mohr criterion.

The aims of a research program at Cambri University, Great Britain, on the stress-st behavior of soils are outlined. The principal ob tive of the research is to develop simple meth for making reliable predictions concerning load-deformation characteristics of soils at working loads. The pressing need for studying load-deformation behavior of soils in mixed bo dary value problems at model scale is emphasi New versatile shear test equipment than can pose a wide range of stress and strain paths, nondestructive methods of checking the uniform of the behavior of specimens are described. Typ data presented for one problem illustrate the va tion of the passive pressure on a retaining wall the displacement of the wall into sand. A revi statement of the Mohr-Coulomb failure criterio proposed, taking into consideration the evide that rupture surfaces coincide with zero-exten lines. Relationships of stress with velocity cha teristics are discussed, and how they might be u to determine the load-deflection behavior of

ructure on or in soil is indicated. The immediate actical importance of centrifugal model tests is own. (USBR)

gineering properties of a compacted, partly satu-ed clay have been determined in a comprehen-e series of laboratory investigations. Results e been correlated with previously published ults of a large number of workers on other clays. lding water content has had a dominant effect a wide range of engineering properties of a com-ted clay soil. Microscopic examination of the structure shows that the major differences exist he macrostructure, and these have accounted the main variations in engineering behavior. practical implications of the findings relate nly to the pore pressure and consolidation avior of compacted clay fill. Natural, partly rated clays will exhibit many similarities, de-ding on whether the air voids are continuous or luded. When clays are dry of the Proctor op-um moisture content, with continuous air voids, consolidation problem exists in the classical e; major problems are associated with swelling collapse on wetting. Wet of the Proctor op-um, with occluded air voids, consolidation is a or problem and the Terzaghi theory is generally elevant as any of the more complex theories. BR)

EXPERIMENTAL AND THEORETICAL INVESTIGATIONS OF A PASSIVE EARTH PRESSURE PROBLEM,
Cambridge Univ. (England).
R. G. James, and P. L. Bransby.
Geotech, Vol 20, No 1, p 17-37, Mar 1970. 23 p, 20 fig, 1 tab, 38 ref.

Descriptors: Bibliographies, *Soil mechanics, *Earth pressure, Sands, *Passive pressure, Laboratory tests, *Retaining walls, Rupturing, *Soil pressure, Failure (Mechanics), Pressure, Failure surfaces.
Identifiers: *Plane strain.

The paper presents data from the experimental investigation of the passive failure of an initially vertical, rough, plane wall which is rotated about its toe into a mass of dry sand with an unloaded horizontal surface. The sand is constrained to deform in plane strain. Measurements are made of the distribution of the normal and shear stresses on the wall while strain fields are determined from observations by an X-ray technique of the positions of lead shot buried in the sand mass. The form of the rupture surface mechanism in dense sand is determined. (USBR)

THE NUMERICAL DETERMINATION OF STRESSES AND DEFORMATIONS IN ROCK TAKING INTO ACCOUNT DISCONTINUITIES,
Karlsruhe Univ. (West Germany).
H. Malina.
Rock Mech, Vol 2, No 1, p 1-16, May 1970. 16 p, 9 fig, 23 ref.

Descriptors: Rocks, Fissures (Geology), Stress, Strain, Theoretical analysis, Bearing capacities, Analysis, Bibliographies, *Rock mechanics, Joints (Geology), *Rock foundations, Rock properties, *Footings, *Finite element method, *Foundations.
Identifiers: Computer applications, Rock footings, Geomechanics.

The finite element method allows the numerical determination of stresses and strains in elastic structures of arbitrary shape. The author uses the method to handle geomechanical problems after additional steps have been introduced to meet the special requirements of geomechanics. In evaluating stresses and strains, calculating the mechanical influence of given joint systems and additional joints caused by material fractures is possible. The paper contains an introduction to the principles of the finite element method and a description of the additional steps required to include inelastic properties. The method of calculation has been programmed for digital computers and has been tested successfully. An example of a continuous footing on rock with one system of joints demonstrates the applicability of the method. (USBR)
W71-05917

MODIFIED TRENCHER SLICES THROUGH FLINT-HARD ROCK,
Lorraine Smith.
Construct Methods Equip, Vol 52, No 6, p 74-78, Jun 1970. 10 fig.

Descriptors: *Rock excavation, *Drilling equipment, *Drainage systems.
Identifiers: *Storm sewers, *Trencher.

A Texas contractor bought a strong stock model trencher and modified it to meet the need for a storm sewer to be cut through hard rock in downtown areas where blasting is forbidden. Major changes in the rig include the addition of three unique features: an adjustable three-part wheel, an hydraulic mast, and an adjustable crumbing shoe. Minor modifications include: converting the mechanical drive train from a 21- to a 42-tooth sprocket to increase torque on the cutting wheel, reinforcing the idler axle, and replacing an 8-foot Jetco arc-type conveyor with the Parsons original. The trencher not only cut through flinty rock, but it kept well ahead of rigs forming the cast-in-place drain.

STABILIZED BASE FOR RESIDENTIAL STREETS,
W. J. Gallup.
Civil Eng, Vol 39, No 5, p 40-42, May 1969.

Descriptors: *Design, *Construction materials, *Illinois, Cements, Construction equipment.

A public works project devised to improve streets and drainage in Stickney Township, Ill. is described. For street improvements, soil cement was used to stabilize bases when streets were covered with 2 in. of asphalt. Depending on the conditions in a particular area, a contractor would either set up a central-mix plant to process base material or would mix it in place. Excavation for the central-mix operation was done with a track-type end loader, a motor grader and dump trucks. Equipment as well as self-loading scrapers were used for in-place processing.

PAVING CURES DUST AND DRAINAGE ILLS,
Jack Lough.
Am City, Vol 84, No 7, p 97-98, Jul 1969.

Descriptors: Concrete construction, Drainage programs, Storm runoff.
Identifiers: Street drainage.

A far-reaching street-paving program was implemented in Albion, Nebraska after heavy rains caused driveway culverts to overflow, ditchwater to stagnate, and runoff to spill into streets and parkways because ditches were clogged. Concrete curbs, gutters, and pavements were installed to ameliorate this situation and also to provide dust control. The entire project cost $473,619.48 (about $5700 per block).
W71-06383

CALCAREOUS PIPE FOR SEWERS,
R. D. Pomeroy.
J Water Pollution Control Fed, Vol 41, No 8, p 1491-1493, Aug 1969.

Descriptors: *Aggregates, *Concrete pipes, *Sewers, *Testing, *Pipes, *Corrosion, Drainage water.
Identifiers: *Pipe materials.

Although the use of calcareous aggregate in the manufacture of concrete pipe for sewers has been advocated for those situations where there is a hazard of mild sulfide conditions, there is a lack of data comparing this material with others. Tests on five 8-inch diameter pipes handling septic waste water were run for a period of seven years. Results show that the rate of corrosion was inversely proportional to the alkalinity of the pipe materials. The pipe with composition of type II cement plus limestone aggregate had a rate of corrosion approximately one-third as great as the average of the others made without limestone aggregate.

LOW COST STORM DRAINAGE WITH PAVED CHANNELS,
Clifford Wendell, and Robert Emmons.
Public Works, Vol 101, No 4, p 110-111, Apr 1970.

Descriptors: *Drainage systems, Design data, Concrete construction, Storm drains.
Identifiers: *Drainage channels.

Rockford, Illinois realized almost a 45% reduction in costs on its drainage system construction by installing concrete paved drainage channels instead of conventional storm sewer systems. Rainfall-runoff data was utilized in designing the channels for the 50-year frequency storm. This longer frequency design provides more adequate protection from flooding, and the channels still retain their self-cleaning capabilities. Dimensions and design diagrams of the paved drainage channels are given.

IMPROVEMENT OF THE CORROSION RESISTANCE OF ALUMINUM BRASS FOR USE IN SEA WATER CONVERSION PLANTS,
IIT Research Inst., Chicago, Ill.
M. A. H. Howes.
For sale by the SOD, GPO, Wash, DC, 20402, Price $0.50. Office of Saline Water Research and Development Progress Report No 628, December 1970. 42 p, 3 tab, 28 fig, 5 ref. OSW Contract 14-01-0001-1770.

Descriptors: *Desalination, *Copper alloys, *Corrosion, *Protective coatings, *Aluminum alloys, Oxidation.
Identifiers: Aluminum-brass, Boehmite, *Aluminum oxide.

The objective of this program was to develop a selective oxidation process which would yield a coherent corrosion-resistant surface layer on aluminum brass. The process was to be suitable for application on industrial equipment. Sixteen different atmosphere compositions were used at temperatures from 800 to 1400F. It was found that the corrosion resistance of aluminum brass could be significantly improved by heating in partially oxidizing atmospheres at 1200 to 1400F. These results are based on autoclave testing, and final conclusions cannot be drawn regarding the effectiveness of the enhanced surface layer until further loop t completed. However, at this stage selectiv tion seems a very promising way of reducin sion rate and improving the life of aluminu in seawater converters. (Filban-Office o Water)

Application of Iron-Aluminum Base A Saline Water Conversion,
Solar, San Diego, Calif.
E. R. Duffy, and J. F. Nachman.
For sale by the SOD, GPO, Wash, DC, Price $0.60. Office of Saline Water Resea Development Progress Report No 626, De 1970. 53 p, 9 tab, 29 fig, 10 ref. OSW Cont 01-0001-1796

Descriptors: *Desalination, *Corrosion, * loys, Iron, Aluminum alloys.
Identifiers: *Iron-aluminum, Alfenol, Therm

The objective of this program is the develop iron-aluminum base alloys which retain re to sea water corrosion with minimum al content and, therefore, maximum ductil scope of testing includes systematic evalu sea water corrosion resistance of three i minum base alloy systems: Alfenol (Fe .. Al menol (Fe .. Al .. Mo), Modified Thermen Al .. Mo .. Zr). The program is divided in stages (1) Fabrication of Test Samples, (2) ing Tests, and (3) Advanced Testing. The loys with the highest aluminum content, al the Thermenol alloy containing ten perc minum, were selected for advanced testing. baseline nor iron-aluminum alloys were sev tacked in the autoclave. The most severe at curred with a Modified Thermenol alloy percent aluminum in sea water steam at 28 alloy was found to be the most corrosion iron-aluminum alloy in moving sea wat molybdenum-bearing iron-aluminum alloys and 16 percent aluminum were equal to or to cupro-nickel in velocity tests at room t ture. However, only the Modified Thermen with 16 percent aluminum approached th sion resistance of cupro-nickel at 190F. (Fi fice of Saline Water)

PLASTICS IN WATER AND SEWAGE TROL,
G. M. Cave.
Surveyor, Vol 84, No 4041, p 44, Nov 21, fig.

Descriptors: *Plastics, *Flow control, * systems, *Construction materials, *Equipm

Rigid plastics, able to provide structural a protective functions, are suggested for use control equipment such as valves, penstock gates, etc. Improvements made in plastics years are noted, and requirements needed troducing the materials to industry are list listed are advantages of well-designed plas stock compared to a conventional unit in c with copper-alloy sealing and bearing s Benefits of these modern materials cannot ized until they are employed to a greater e civil engineering contractors and by engi the water purification industry.
W71-06286

GLASS FIBER-REINFORCED PLASTICS FOR WATER PIPELINES,
E. Faust.
Kunststoffe-Plastics (KUPLAK), Vol 15, 191-193, 1968.

Descriptors: *Pipelines, *Plastics, Cons equipment, Sewers.
Identifiers: *Fiberglass pipe.

Glass fiber-reinforced plastic pipes for water pipelines and sewer pipe systems are described. The technical and economic advantages of applications of plastics in sewer pipes are detailed. Requirements that must be taken into account in selecting proper plastics for special purposes with regard to the use of a glass reinforced polyester pipe are mentioned. The properties and performance of the pipe made by filament winding and centrifugal casting techniques are listed, and the comparison of the production method by filament winding with that by centrifugal casting is examined.
W71-06291

IBERGLASS WINS PIPELINE,
William Marquardt.
Water Sewage Works, Vol 116, No 6, p 228-229, Jun 1969. 3 fig.

Descriptors: *Bids, *Piping systems (Mechanical), Construction materials, Comparative costs.
Identifiers: *Fiberglass pipe, *San Francisco.

Corrosion resistant fiberglass was chosen over a cement-mortar lined steel pipe in competitive bidding for the replacement of a corroded waste return piping system in the San Francisco area. The fiberglass pipe weighed one-tenth of the weight of the cement-lined steel pipe, and the cost of the fiberglass pipe was $5 per foot less. Hydrogen sulfide caused leakage of the original pipe by penetrating the cement lining and steel wall at the welded seams. Three types of fiberglass reinforced plastic (FRP) were used in constructing various parts of the waste return piping system. Dimensions and descriptions of the three pipe types are given, and installation methods are also discussed. Alternate materials investigated and rejected were: cement-lined steel, cement-lined cast iron, asbestos cement, plastic protected metal (IPM), reinforced concrete, glass or glass-lined pipe, uncoated steel or cast iron, epoxy-coated steel, and vitrified clay pipe. Reasons for rejecting these materials were given.
W71-06300

WERS UNDER ATTACK,
L. Marsden-Jones, and J. A. Foster.
Surveyor, Vol 85, No 4053 and 4055, Feb 13 and 20, 1970. 3 p.

Descriptors: *Construction materials, *Pipes, Concrete pipes, Asbestos cement.
Identifiers: *Sanitary sewers.

L. Marsden-Jones: With reference to the article, 'Sewers Under Attack' (9 January), he questions whether or not the use of bitumen-coated asbestos pipe implied that concrete could not be used for sanitary sewers. He also wonders if gravel used to surround pipes produces a drainage effect that drains farm land where groundwater is short in supply and, at sewage works, raises groundwater level causing floods. J. A. Foster: In reply to this last question, he notes that only the specific circumstances at Doncaster warranted use of bitumen asbestos-cement pipes and that for most sanitary sewers, concrete is a suitable material. He further explains reasons for Doncaster's use of the unusual material. In answer to the second point, he states that normal practice in waterlogged ground is to apply impervious clay cut-off walls at proper intervals to prevent groundwater movement along pipelines.
W71-06301

ASTIC FITTINGS SPEED LAYING OF SEWER PIPE.
Contract Record, Vol 81, No 10, p 73, Oct 1968.

Descriptors: *Pipes, *Construction equipment, Construction materials, Installation.
Identifiers: *Transite pipe system.

The Roll-Tite system which combines a Transite asbestos-cement pipe with a new type of plastic fitting blow-molded from black polypropylene, is described. The installing operation for this system takes considerably less time than for other systems. Other advantages of this system as well as distributive information are mentioned.
W71-06338

PLASTIC MAY BE PIPELINER'S BOON.

Eng News-Record, Vol 184, No 10, p 28-29 Mar 5, 1970.

Descriptors: *Plastic pipes, *Installation, Cost comparisons, Construction materials.
Identifiers: *Germany, *Fusion welding.

In Germany, plastic pipes with up to 40-inch diameters and pieced in 500 to 1,000 foot sections are common engineering equipment. These polyethylene pipes cost slightly more than other types of pipes; however, installation costs are drastically lower, especially when used in long runs. The butt-fusion welding practice is quite routine in Europe. This process of installation is described.
W71-06339

SEWERS UNDER ATTACK.

Surveyor, Vol 85, No 4048, p 38, Jan 9, 1970. 2 fig.

Descriptors: *Construction, *Construction materials, *Sewers, *Pipes, *Installation, Cements.
Identifiers: *Great Britain.

Doncaster sewers were improved once in 1956, but in 1966 a major reconstruction of the pipes was necessitated due to corrosion by sulfuric acid produced by bacterial action. Adjacent to the old sewer, the new sewer was constructed in the material most resistant and readily available, namely, bitumen-coated asbestos-cement. Procedures followed for construction and installation of the pipes is described.
W71-06349

PUBLIC WORKS EXHIBITION PREVIEW.

Surveyor, Vol 82, No 3988, p 82, 130, 135, Nov 9, 1968. 5 fig.

Descriptors: *Construction materials, *Construction equipment, *Drainage systems, *Underground structures, Sewerage, Plastic pipes, Pipes.

Among the previewed exhibits of the Public Works and Municipal Services Exhibition were Metrex sewage and drainage and rigid PVC rainwater systems, a large range of PVC pressure pipe, examples of asbestos-cement pressure pipes, Polydrain PVC underground drainage systems, and plastic pipes. The PVC pressure pipes had a push type Z joint with a lip rubber seal. This joint, which is easy and quick to assemble, had been made practicable for pressure mains of large diameters up to 18 inches. The asbestos-cement pipe display showed not only new pipes but also old, well-preserved pipe that had lain in the soil for many years. One exhibit demonstrated the economy gained in cost, labor, weight, and maintenance when using plastic pipes and systems.

ALUMINUM PIPELINE FOR SEA OUTFALL SEWER.
Water Waste Treat, Vol 12, No 11, p 361, Jan/Feb 1970.

Descriptors: *Aluminum, *Pipelines, *Installation, *Construction equipment, *Construction materials, Outfall.
Identifiers: *Great Britain, *Trestles.

A welded aluminum pipeline has been used to extend a sea outfall sewer at Anglesey. Aluminum was selected because of its weight, corrosive nonliability, strength, and resistance to seawater and domestic sewage. The pipeline was assembled progressively by bolting the flanged ends of the 100-foot pieces underwater. The aluminum trestles, to support the pipeline, and the method of installation are described.
W71-06355

STEEL PIPE SELECTED FOR STORM SEWER SYSTEM.

Am City, Vol 85, No 3, p 22, Mar 1970.

Descriptors: *Pipes, Construction costs.
Identifiers: Steel pipes, Storm sewers, Sewer system.

Steel piping instead of the more-commonly used reinforced concrete was employed to construct a storm sewer system in Lakewood, New York. Advantages of this material include its strength, lighter weight, and lower cost. Savings in material cost alone were about 15%, and lower labor costs were incurred because steel is simpler to handle than other materials. Dimensions of the storm sewer system are given.
W71-06360

STEEL STORM SEWER SAVES MONEY FOR PHOENIX,
Sam A. Phillips.
Water Wastes Eng, Vol 6, No 4, p 56-57, Apr 1969.

Descriptors: *Storm drains, *Installation costs, Construction materials, Steel.
Identifiers: *Storm sewers.

In order to fulfill the need for additional storm sewers at the lowest possible cost, the City of Phoenix asked for bids on types of materials which could be used in the construction of an efficient and durable storm drainage system. The city lately installed two such pipelines of asphalt-lined and corrugated, galvanized steel for a cost 20 to 25% below the city engineers' estimate given before other bids were requested. Completed in 1967, these new systems appear completely satisfactory, and their installation was accomplished with greater facility and speed than is usual when materials other than galvanized steel are used.
W71-06406

INSULATED CO-AXIAL PIPELINES,
J. S. W. Riach.
Pipes Pipelines Intern, Vol 13, No 11, p 27-28, 30, Nov 1968.

Descriptors: *Pipes, *Installation, *Piping systems (Mechanical), Drainage.

The installation procedure of a conduit system of inner and outer pipes that is prefabricated off-site in 40 ft lengths together with all elbows, expansion loops, tees, and other special sections is described. It is then delivered to the site for assembly. The annular air space between service pipe insulation and the interior of conduit provides drainage passage for any water which may inadvertently enter the system.
W71-06408

GALVANIZED BETH-CU-LOY STEEL SHEETS - FOR CULVERT PIPE AND UNDERDRAINS.
Bethcon Galvanized Steel Sheets, Bethlehem Steel, Bethlehem, Pa., Booklet 1956, p13-14. 2 fig.

Descriptors: *Steel, *Fabrication, *Construction materials.

Identifiers: *Beth-Cu-Loy.

Beth-Cu-Loy is Bethlehem's trade name for steel which has a small amount (.2 to .3 percent) of copper added to it for resistance to corrosion. When given a 2-oz coating of zinc, and then corrugated, these steel sheets form ideal materials for fabrication of culvert and drainage structures. Bethlehem manufactures culvert sheets for fabricators who form them into culverts and underdrains. Dimensions available are given along with advantages of the materials used, such as their strength and their light weight.
W71-06419

CORRUGATED STEEL PIPE STORM SEWERS.

National Corrugated Steel Pipe Assoc, Schiller Park, Illinois, Booklet STM 168. 32 p.

Descriptors: *Construction materials, *Steel, *Culverts, *Design, *Steel pipes, *Construction equipment, Installation, Data collections, Design standards.
Identifiers: *Storm sewers.

Corrugated steel is the accustomed material used in urban areas for culverts and storm sewers which form a part of Interstate highway construction. This technical manual provides information needed for the design of storm sewers which differ from culverts in details of hydraulics and fittings. The use of corrugated steel pipe insures that the following essentials will be provided: (1) strength, (2) positive couplings, (3) long service life, (4) unchanging hydraulic properties, (5) versatile fittings, and (6) proved materials. Each of these factors is demonstrated in corrugated steel pipe storm sewers. Product details are discussed, including sizes and details of the pipe and pipe-arch; couplers and fittings; and bituminous protective coatings. Technical data explained include: hydraulics and the determination of size, Manning charts, structural design, the height of cover tables, and service life design. Also described are techniques for installation and specifications for materials, fabrication, workmanship and finish, and inspection.
W71-06420

TANKS.

Owens-Corning Fiberglas Corp, Toledo, Ohio, Publ No 1-PE-3578-F, June 1970. 8 p.

Descriptors: *Storage tanks, *Construction materials, *Construction equipment, *Design, *Plastics, Treatment facilities.
Identifiers: *Fiberglas reinforced plastics.

The combined Fiberglas reinforced plastics have been utilized for years in demanding applications because of their chemical and electrolytic corrosion resistance and structural stability. The process industry uses these plastics for chemical storage tanks, gathering lines, salt water injection, and disposal oil well tubing. A detailed description of the design and manufacturing of Fiberglas Reinforced Plastic (FRP) storage tanks is included. Applications for this type of non-corrosive tank are mentioned with special reference to the use of Fiberglas tanks in providing the most economical solution to severe corrosive problems in holding, treating, and settling tanks.
W71-06421

PLASTICS IN WATER AND SEWAGE CONTROL,
C. A. J. Benfield.
Surveyor, Vol 85, No 4048, p 2, Jan 9, 1970.

Descriptors: *Construction materials, *Design criteria, *Plastics.
Identifiers: *Polyester resins.

In this letter to the editor, the author attempts to clarify the original article's reference to inadequacies of glass fiber reinforced polyester resin (RP) when submersed in water. He notes that considerable research has shown raw materials in the form of improved polyester resins, glass sizes, and fabricating processes to permit application of RP in environments of total immersion in water. Practical experience has demonstrated that by considering certain design criteria, RP laminates can be and are being used in the water and sewage control industry. The author also suggests that 'case histories', written by users of plastics components, be published in the journal in order to promote dissemination of design and performance data within the water purification industry, as was recommended in the original article.

PLASTIC RELINING OF SMALL-DIAMETER PIPES,
Raymond M. Bremver.
J Saint Eng Div, Am Soc Civil Engrs, Vol 96, No SA2, p 297-317, Apr 1970.

Descriptors: *Storm drains, *Sewerage, Pipes.
Identifiers: *Toronto, *Storm sewers, *Combined sewers, Plastic pipes, Capacity.

The combined sewer system of the city of Toronto measures approximately 933 miles. In 1965, a 25 year staged and planned program for installing new storm sewers at a net cost of $154 million was instituted as a result of the hydraulic inadequacies of the then existing system. A chart showing the inventory results concerning the sewer system is given. The surcharge amount on water bills is explained and the common defects in the existing sewers are discussed. A detailed report on the method of relining the existing sewers, which involves the insertion of high density plastic pipes into the sewers and the connecting of all private and catch basin drains into the plastic conduit, is given. The effect of relining on hydraulic capacity is explained.

Identifiers: Exploratory hole.

In order to assess the feasibility of fracturing the oil shale in the central part of Uinta Basin in Uintah County, Utah by underground explosion of a nuclear device, an exploratory hole (WOSCO exploratory hole Ex. 1) was drilled during July 1969. Geohydrologic data obtained from this hole, drilled to a depth of 3,234 feet, and other nearby wells are presented along with an interpretation of the data. Jetting tests and a flow test of three water-bearing zones in the Green River Formation of Eocene age indicated very low transmissivities (6 to 18 gall per day per foot) and hydraulic heads sufficient cause flow at the surface. The three zones ha combined flow of 5 gallons per minute. Water fr these zones is briny, ranging in concentration fr 37,000 to 72,700 milligrams per liter of dissolv solids. If a nuclear explosive is detonated at a de of 2,370 feet, just below the apparent rich kerogen-bearing part of the oil shale penetrat fracturing reportedly would not extend downw into the upper water-bearing zone of the Gr River Formation. Under these conditions, wa very likely will not flow into the rubble chimn made by the nuclear explosion. (Woodard-USGS

W71-06109 04A

ALGICIDES,
W71-06189 05C

ALGAE CULTURE TECHNIQUE
ALGAECIDAL EVALUATION AND ENVIRONMENTAL STUDY OF MAT PRODUCING BLUEGREEN ALGAE,
W71-06102 04A

ALGAL CONTROL
ALGICIDES,
W71-06189 05C

DEVELOPMENT OF PHOSPHATE-FREE HOME LAUNDRY DETERGENTS,
W71-06247 05G

ALGAL TOXINS
ALGAL TOXINS,
W71-05999 02I

ALGICIDES
ALGAECIDAL EVALUATION AND ENVIRONMENTAL STUDY OF MAT PRODUCING BLUEGREEN ALGAE,
W71-06102 04A

ALGICIDES,
W71-06189 05C

ALKALINE EARTH METALS
ION-SELECTIVE ELECTROCHEMICAL SENSORS - SECOND REPORT,
W71-06240 03A

ALKYLBENZENE SULFONATES
EFFECTS OF ALKYL BENZENE SULFONATE ON RAINBOW TROUT,
W71-06325 05C

ALLOCATION
AN ECONOMIC ANALYSIS OF THE INTERTEMPORAL ALLOCATION OF GROUNDWATER IN THE CENTRAL OGALLALA FORMATION,
W71-06266 04B

ALLOCATIVE EFFICIENCY
COLLECTIVE ACTION AND THE DISTRIBUTION OF INCOME A CONCEPTUAL APPROACH,
W71-05960 06C

ALLUVIAL CHANNELS
HYDRODYNAMIC EFFECTS OF SEEPAGE ON BED PARTICLES,
W71-05839 02J

FLAT-VEE WEIRS IN ALLUVIAL CHANNELS,
W71-05849 08B

ALTERATION OF FLOW
DRAINAGE DIST NO 7 V HAVERSTICK (LIABILITY FOR DIVERSION OF NATURAL WATERCOURSE).
W71-05876 06E

ALUMINUM
ANGLESEY ALUMINUM SEA OUTFALL,
W71-06289 08A

ALUMINUM PIPELINE FOR SEA OUTFALL SEWER.
W71-06355 08G

ALUMINUM ALLOYS
IMPROVEMENT OF THE CORROSION RESISTANCE OF ALUMINUM BRASS FOR USE IN SEA WATER CONVERSION PLANTS,
W71-06234 08G

ALUMINUM OXIDE
IMPROVEMENT OF THE CORROSION RESISTANCE OF ALUMINUM BRASS FOR USE IN SEA WATER CONVERSION PLANTS,
W71-06234 08G

AMERICAN WATER WORKS ASSOCIATION
75 YEARS OF IMPROVEMENT IN WATER SUPPLY QUALITY,
W71-05943 06E

AMINO ACIDS
NITROGEN AND AMINO ACIDS IN THE FECES OF YOUNG PIGS RECEIVING A PROTEIN-FREE DIET AND DIETS CONTAINING GRADED LEVELS OF SOYBEAN OIL MEAL OR CASEIN,
W71-06451 05B

AMMONIA
UREA CONVERSION TO AMMONIA IN WATERLOGGED SOILS,
W71-05866 02K

TREATMENT OF FISH HATCHERY EFFLUENT FOR RECYCLE,
W71-06024 05D

AMMONIA VOLATILIZATION
UREA CONVERSION TO AMMONIA IN WATERLOGGED SOILS,
W71-05866 02K

AMMONIUM COMPOUNDS
CHEMISTRY OF NITROGEN IN SOILS,
W71-06436 05B

AMPHIPODA
THE EFFECTS OF THE HERBICIDES DIQUAT AND DICHLOBENIL (CASORON) ON POND INVERTEBRATES PART I. ACUTE TOXICITY,
W71-06181 05C

ANACOSTIA RIVER
STORAGE BLADDERS FOR SEWAGE.
W71-06344 05G

ANAEROBIC BACTERIA
POLLUTION, BY BIOSYNTHESIS 'IN SITU' OF CARCINOGENOUS HYDROCARBONS, OF A LAGOON BIOCENOSIS 'IN VITRO' REPRODUCT OF THIS PHENOMENON (IN FRENCH),
W71-06209 05B

ANAEROBIC CONDITIONS
EVALUATION OF SOME STABILIZATION PONDS IN INDIA,
W71-06033 05D

TREATMENT OF ORGANIC INDUSTRIAL WASTES BY LAGOONING,
W71-06036 05D

ANAEROBIC DIGESTION
ANAEROBIC DECOMPOSITION OF SWINE EXCREMENT,
W71-06453 05D

ANALYSIS
CANAL CAPACITY STUDIES MAIN CANAL COLUMBIA BASIN PROJECT,
W71-06109 04A

VELOCITY MEASUREMENTS IN SEWERS VITAL TO DESIGN AND MAINTENANCE,
W71-06394 08B

ANALYTIC TECHNIQUES
SIMULATION OF RUNOFF FROM URBAN WATERSHEDS,
W71-06306 04C

ANALYTICAL TECHNIQUES
ION-SELECTIVE ELECTROCHEMICAL SENSORS,
W71-06239 03A

ION-SELECTIVE ELECTROCHEMICAL SENSORS - SECOND REPORT,
W71-06240 03A

CHARACTERIZATION AND CONTROL OF COMBINED SEWER OVERFLOWS, SAN FRANCISCO,
W71-06326 08B

ANCHORAGES
NAVIGATION AND NAVIGABLE WATERS,
W71-06049 06E

ANIMAL MANURE
EFFECT OF SOIL TEMPERATURE ON THE AVAILABILITY OF PHOSPHO IN ANIMAL MANURES,
W71-06455 05C

ANIMAL METABOLISM
LACTIC AND PYRUVIC ACID CHANGES IN BLUEGILL SUNFISH (LEPO MACROCHIRUS RAFINESQUE) DURING GRADUAL HYPOXIA AT TWO ACCLIMATION TEMPERATURES (5 AND 20C),
W71-06320 05C

ANION EXCHANGE RESINS
PHOSPHATE REMOVAL FORM TERTIARY EFFLUENT WITH ION EXCHANG MATERIALS,
W71-05926 05D

ANNULAR PIPES
TURBULENT FRICTION IN ECCENTRIC ANNULAR CONDUITS,
W71-06402 08B

ANTARCTIC
THE ORIGIN OF THE LABYRINTH, WRIGHT VALLEY, ANTARCTICA,
W71-05847 02J

ANTIMYCIN-A
SOME EFFECTS OF ANTIMYCIN IN AN OLIGOTROPHIC LAKE,
W71-06323 05C

APPALACHIA
WATER USE BY APPALACHIAN MANUFACTURERS,
W71-06319 06D

APPLICATION METHODS
HOW TO SELECT AND APPLY ZINC FERTILIZER,
W71-06059 03F

SEED TABLETS FOR PRECISION PLANTING LETTUCE,
W71-06224 03F

LASER BEAM AND POWDER-ACTUATED TOOL SPEED PIPE LAYING.
W71-06354 08C

ALTERNATIVES TO SEPARATION OF COMBINED SEWERS,
W71-06374 05D

AQUACULTURE
SANITARY CONTROL OF SHELLFISH IN KOREA,
W71-06110 02L

AQUATIC ENVIRONMENT
PROBLEMS IN DISPOSAL OF WAST HEAT FROM STEAM-ELECTRIC PLANTS.
W71-05931 08A

AQUATIC INSECTS
THE EFFECTS OF THE HERBICIDES DIQUAT AND DICHLOBENIL (CASORON) ON POND INVERTEBRATES PART I. ACUTE TOXICITY,
W71-06181 05C

AQUATIC LIFE
THERMAL POLLUTION, AQUACULTURE AND PATHOBIOLOGY IN AQUATIC SYSTEMS,
W71-06092 05C

THE OCCURRENCE OF POLYCYCLIC AROMATIC CARBOHYDRATES IN COASTAL WATERS AND ITS POSSIBLE EFFECTS ON MAN'S HEALTH (IN GERMAN),
W71-06207 05C

AQUATIC MICROORGANISMS
POWER PLANTS EFFECTS OF CHLORINATION ON ESTUARINE PRIMARY PRODUCTION,
W71-06097 05C

AQUATIC WEED CONTROL
PHYSICAL PROPERTIES AND PROCESSING CHARACTERISTICS OF MACROPHYTES AS RELATED TO MECHANICAL HARVESTING,
W71-06188 04A

HERBICIDE RESIDUES IN AGRICULTURAL WATER FROM CONTROL OF AQUATIC AND BANK WEEDS,
W71-06440 05B

AQUATIC WEEDS
ALGAECIDAL EVALUATION AND ENVIRONMENTAL STUDY OF MAT PRODUCING BLUEGREEN ALGAE,
W71-06102 04A

AQUIFER
SEEPAGE FACE EFFECTS IN UNSTEADY GROUNDWATER FLOW,
W71-06190 02F

AQUIFERS
RECONNAISSANCE INVESTIGATION OF THE SUBSIDENCE OF VENICE AND SUGGESTED STEPS TOWARD ITS CONTROL,
W71-05870 02F

COMPUTER METHODS FOR TRANSIENT ANALYSIS OF WATER-TABLE AQUIFERS,
W71-05920 02F

ARCTIC REGIONS
A STUDY OF THE BEHAVIOR OF OIL SPILLS IN THE ARCTIC,
W71-06101 05B

SETTLING CHARACTERISTICS OF ACTIVATED SLUDGE AT LOW TEMPERATURE,
W71-06107 05D

A RATIONAL APPROACH TO THE DESIGN OF AERATED SEWAGE LAGOONS,
W71-06267 05D

ARID CLIMATES
PROBLEMS OF POLLUTION OF IRRIGATION WATERS IN ARID REGIONS,
W71-06112 05B

ARID LANDS
THE WOODSMAN'S ASSAULTS ON THE DOMAIN OF THE CATTLEMAN,
W71-06072 03F

WATER QUALITY MANAGEMENT PROBLEMS IN ARID REGIONS.
W71-06111 05G

NATURAL POLLUTION IN ARID LAND WATERS,
W71-06113 05B

ARIZONA
OPERATIONS RESEARCH STUDY OF WATER RESOURCES - PART II,
W71-06307 06A

ARKANSAS
CGEHEE V WILLIAMS (CONTRACT BETWEEN CITIES FOR PROVISION OF WATER).
W71-05836 06E

DRAINAGE DIST NO 7 V HAVERSTICK (LIABILITY FOR DIVERSION OF NATURAL WATERCOURSE).
W71-05876 06E

WELL RECORDS, DEPTH-TO-WATER MEASUREMENTS, CHEMICAL ANALYSES OF GROUND WATER, DRILLERS LOGS, AND ELECTRIC-LOG INFORMATION IN HEMPSTEAD, LAFAYETTE, LITTLE RIVER, MILLER, AND NEVADA COUNTIES, ARKANSAS,
W71-06229 04B

ARTESIAN WELLS
SALINE ARTESIAN WATER AS A SUPPLEMENT,
W71-06124 03C

ARTHROPODS
INFLUENCE OF INDUSTRIAL EFFLUENTS ON ARTHROPODS OF THE MARINE SUPRALITTORAL ZONE, (IN GERMAN),
W71-06003 05C

ARTIFICIAL PRECIPITATION
OPPORTUNITIES FOR MODIFYING WEATHER TO AUGMENT PRECIPITATION AND SUPPRESS HAIL,
W71-06132 03B

ARTIFICIAL RECHARGE
ARTIFICIAL RECHARGE PRACTICES IN HAWAII,
W71-06263 04B

ASBESTOS PANEL METHOD
POSSIBILITY OF STUDYING THE EFFECTS OF POLLUTION ON BENTHIC ORGANISMS EMPLOYING IMMERSED PANELS (IN FRENCH),
W71-06205 05C

ASBESTOS-CEMENT PIPING
SEWER IMPROVEMENTS CALL FOR TRUNK.
W71-06353 08F

ASPHALT
CHARACTERIZATION OF OIL SLICKS ON SURFACE WATERS,
W71-06261 05A

ASTERIONELLA NOTATA
ANTIBACTERIAL ACTIVITY OF A MARINE DIATOM ASTERIONELLA NOTATA (GRUN) (IN FRENCH),
W71-06211 05C

ATTITUDES
SOCIO-CULTURAL IMPACTS OF WATER RESOURCE DEVELOPMENT IN THE SANTIAM RIVER BASIN,
W71-05921 06B

AUSTIN
TV INSPECTION AND IN-PLACE GROUTING OF SEWERS,
W71-06427 07B

AUSTRALIA
WATERFRONT LAND USE IN THE AUSTRALIAN STATE CAPITALS,
W71-06065 06B

STORM WATER RETARDING BASINS SOLVE URBAN DRAINAGE PROBLEMS,
W71-06364 05G

INFILTRATION IN SEWERS,
W71-06403 08A

BACKFILL
SCAPER PRODUCTION SPEEDS PIPE TRENCHING AT LOWER COSTS,
W71-06287 08C

BACKWATER
JACOBS V UNITED STATES (COMPENSATION FOR LAND RENDERED MORE SUSCEPTIBLE TO OVERFLOW).
W71-06296 06E

BACTERIA
CONDITIONS AFFECTING THE REDUCTION OF IRON AND MANGANESE BY BACTERIA IN THE ORE-BEARING LAKES OF THE KARELIAN ISTHMUS,
W71-05993 02K

ECOLOGY OF SELECTED BACTERIA IN A SMALL INTERMITTENT SEWAGE POND,
W71-05995 05D

ALDRIN REMOVAL FROM LAKE WATER BY FLOCCULENT BACTERIA,
W71-06000 05G

STUDY OF THE INFLUENCE OF BDELLORIBRIO BACTERIOROUS IN MARINE SELF-PURIFICATION (IN FRENCH),
W71-06204 05C

BADGER MAJOR
TRENCHLESS PIPELAYING DEMONSTRATED.
W71-06358 08C

BAFFLES
PROCESS OPTIMA IN ACTIVATED SLUDGE,
W71-06032 05D

BALANCE OF NATURE
THE ECOLOGY AND OCEANOGRAPHY OF SEWER OUTFALLS,
W71-05928 06G

BANGKOK(THAILAND)
DEVELOPMENT OF WATER RESOURCES IN ASIA AND THE FAR EAST-REPORT OF THE NINTH SESSION OF THE BIENNIAL REGIONAL CONFERENCE ON WATER RESOURCES DEVELOPMENT.
W71-05864 06B

BAYGON
A POTENTIAL CONTROL FOR LEECHES,
W71-06322 05C

BAYS
SUMMER THERMAL STRUCTURE AND CIRCULATION OF CHEQUAMEGON BAY, LAKE SUPERIOR--A FLUCTUATING SYSTEM,

W71-05885 02H

JAMAICA BAY AND KENNEDY AIRPORT A MULTIDISCIPLINARY ENVIRONMENTAL STUDY.
W71-06045 06G

METHOD OF AND MEANS FOR DEALING WITH STORM-WATER OVERFLOWS IN SEWERS AND LIKE DRAINAGE SYSTEMS,
W71-06375 08B

BAYTEX
A POTENTIAL CONTROL FOR LEECHES,
W71-06322 05C

BEACH DECONTAMINATION
A FEASIBILITY ANALYSIS OF INCINERATOR SYSTEMS FOR RESTORATION OF OIL CONTAMINATED BEACHES,
W71-06252 05E

BEACH EROSION
FLOOD PLAIN INFORMATION, ONTONAGON RIVER, ONTONAGON, MICHIGAN, AND LAKE SUPERIOR SHORELINE, ONTONAGON COUNTY, MICHIGAN.
W71-06232 04A

BEACHES
A FEASIBILITY ANALYSIS OF INCINERATOR SYSTEMS FOR RESTORATION OF OIL CONTAMINATED BEACHES,
W71-06252 05E

BEAR RIVER
WATER RELATED LAND USE IN THE BEAR RIVER DRAINAGE AREA,
W71-06212 07C

BED LOAD
THE MATTHES ROLLING DIAMETER AS AN INDICATOR OF CHANNEL STABILITY,
W71-06169 02J

BEDDING MATERIAL
WINNER 3.6 UNDER ON CALIFORNIA STORM DRAIN.
W71-06340 08F

BEEF FEEDING INDUSTRY
IMPLICATIONS OF WATER QUALITY LAWS FOR THE FEEDLOT INDUSTRY,
W71-06222 05G

BELGIUM
DESIGN OF SUB-SURFACE DRAINAGE SYSTEM FOR INNER RING ROAD OF CITY OF ANTIWERP,
W71-06391 08B

BENEFICIAL USE
USE ANIMAL MANURE EFFECTIVELY,
W71-06454 05D

BENTHOS
BENTHIC PRODUCTIVITY,
W71-06020 02L

STUDIES ON ULVA AND OTHER BENTHONIC MARINE ALGAE RECEIVING TREATED SEWAGE IN PONDS AND IN CALICO CREEK AT MOREHEAD CITY, NORTH CAROLINA,
W71-06021 02L

POSSIBILITY OF STUDYING THE EFFECTS OF POLLUTION ON BENTHIC ORGANISMS EMPLOYING IMMERSED PANELS (IN FRENCH),
W71-06205 05C

BETH-CU-LOY
GALVANIZED BETH-CU-LOY STEEL SHEETS - FOR CULVERT PIPE AND UNDERDRAINS.
W71-06419 08G

BIBLIOGRAPHIES
INTERBASIN DIVERSION OF WATER AN ANNOTATED BIBLIOGRAPHY,

SKASKIA RIVER(ILL)
PERIPHYTON ACCRUAL IN THE KASKASKIA RIVER AND ADJACENT FLOODPLAIN POOLS IN EAST-CENTRAL ILLINOIS,
W71-06011 02I

NTUCKY
JONES V LOUISVILLE AND NASHVILLE RY (RECOVERY FOR FLOOD DAMAGE BY CONTRIBUTOR THERETO).
W71-06303 06E

WEENAW WATERWAY(MICH)
THE USE OF CONCENTRATIONS OF ELECTROLYTES AND NATURALLY FLUORESCENT MATERIALS TO STUDY WATER MASS MOVEMENTS IN A FRESHWATER 'ESTUARY',
W71-05877 02L

NGFISHER(OKLA)
FLOOD PLAIN INFORMATION, KINGFISHER AND UNCLE JOHN'S CREEKS, KINGFISHER, OKLAHOMA.
W71-06119 04A

GS RIVER(CALIF)
THE DEVELOPMENT AND APPLICATION OF A HYDROLOGIC MODEL AS AN OPERATIONAL TOOL,
W71-06135 02C

NG-LANGAT DELTA(MALAYSIA)
SEDIMENTATION IN A MALAYSIAN HIGH TIDE TROPICAL DELTA,
W71-05858 02J

EA
ANITARY CONTROL OF SHELLFISH IN KOREA,
W71-06110 02L

ORATORY TESTS
INVESTIGATIONS OF THE TECHNIQUES OF PURIFICATION OF ALGAL CULTURES ELABORATION OF METHODS APPLICABLE TO DESMIDS, FILAMENTOUS CYANOPHYTES, AND DIATOMS, (IN FRENCH),
W71-06002 07B

ADIAL WATER AND SOLUTE FLOWS IN ROOTS OF ZEA MAYS I. WATER FLOW,
W71-06064 02I

ABORATORY SIMULATION OF SNOWMELT,
W71-06139 02C

TUDIES ON THE CHEMICAL CONTROL OF TREE ROOTS IN SEWER INES,
W71-06397 04A

TIC ACID
ACTIC AND PYRUVIC ACID CHANGES IN BLUEGILL SUNFISH (LEPOMIS ACROCHIRUS RAFINESQUE) DURING GRADUAL HYPOXIA AT TWO CCLIMATION TEMPERATURES (5 AND 20C),
W71-06320 05C

E ASHTABULA(ND)
RIMARY PRODUCTION AND CHEMICAL AND PHYSICAL CHARACTERISTICS F LAKE ASHTABULA RESERVOIR, NORTH DAKOTA,
W71-06008 02H

E CHAMPLAIN(NY-VT)
AKE CHAMPLAIN IN RELATION TO REGIONAL WATER SUPPLY,
W71-05875 03B

E ERIE
RACE ELEMENTS IN LAKE ERIE,
W71-05880 05A

OME VARIATION IN THE QUALITY OF WATER FROM THE SOURCE AND OUTH OF THE NIAGARA RIVER,
W71-05881 05A

IND INDUCED CIRCULATION PATTERN IN A ROTATING MODEL OF LAKE RIE,
W71-05891 02H

AVE FORCES IN LAKE ERIE,
W71-05894 02H

ONTHLY VARIATION IN PHOSPHATE AND RELATED CHEMICALS FOUND N THE SEDIMENT IN THE ISLAND AREA OF LAKE ERIE, 1967-68, WITH REFERENCE TO SAMPLES COLLECTED IN 1964, 1965, AND 1966,
W71-06187 05B

APPLIES EXISTING TECHNOLOGY FOR A CLEANER LAKE ERIE.
W71-06359 05G

STORM WATER TREATMENT AT CLEVELAND,
W71-06389 05D

LAKE HURON
SURFACE WATER INPUTS OF IODINE, BROMINE, AND CHLORINE TO LAKE HURON,
W71-05882 05B

LAKE LIVINGSTON
SELECTIVE WITHDRAWAL AT LAKE LIVINGSTON, PRELIMINARY EVALUATIONS, 1969,
W71-06193 05C

LAKE MICHIGAN
STATISTICAL ANALYSIS OF CURRENTS AT TWO NEAR-BY STATIONS IN LAKE MICHIGAN, SUMMER, 1967,
W71-05893 02H

VISUAL WAVE OBSERVATIONS ALONG THE LAKE MICHIGAN SHORE,
W71-05899 02H

DIURNAL CHANGES IN STRATIFICATION AND DISSOLVED OXYGEN IN THE SURFACE WATERS OF LAKE MICHIGAN,
W71-05900 02H

PLANKTON DIATOM ASSEMBLAGES IN LAKE MICHIGAN,
W71-05984 05C

A CASE STUDY OF COASTAL CURRENTS IN LAKE MICHIGAN,
W71-06174 02H

LAKE ONTARIO
REMOVAL OF CONTAMINANTS FROM LAKE ONTARIO BY NATURAL PROCESSES,
W71-05878 05G

INVESTIGATIONS OF DAILY VARIATIONS IN CHEMICAL BACTERIOLOGICAL AND BIOLOGICAL PARAMETERS AT TWO LAKE ONTARIO LOCATIONS NEAR TORONTO, PART I--CHEMISTRY,
W71-05879 05A

SOME VARIATION IN THE QUALITY OF WATER FROM THE SOURCE AND MOUTH OF THE NIAGARA RIVER,
W71-05881 05A

BOTTOM SEDIMENT SAMPLING,
W71-05886 07B

THE QUALITATIVE DISTRIBUTION OF FELDSPARS IN SURFICIAL BOTTOM SEDIMENTS FROM LAKE ONTARIO,
W71-05889 02J

LARGE-SCALE DIFFUSION STUDIES AT NIAGARA RIVER MOUTH, LAKE ONTARIO,
W71-05901 07B

JULY CURRENTS NEAR THE SOUTH SHORE OF LAKE ONTARIO,
W71-05978 02H

LAKE RESTORATION
REGENERATION OF THE SEVAN,
W71-06330 02H

LAKE SEVAN
REGENERATION OF THE SEVAN,
W71-06330 02H

LAKE SUPERIOR
THE USE OF CONCENTRATIONS OF ELECTROLYTES AND NATURALLY FLUORESCENT MATERIALS TO STUDY WATER MASS MOVEMENTS IN A FRESHWATER 'ESTUARY',
W71-05877 02L

SUMMER THERMAL STRUCTURE AND CIRCULATION OF CHEQUAMEGON BAY, LAKE SUPERIOR--A FLUCTUATING SYSTEM,
W71-05885 02H

FLOOD PLAIN INFORMATION, ONTONAGON RIVER, ONTONAGON, MICHIGAN, AND LAKE SUPERIOR SHORELINE, ONTONAGON COUNTY, MICHIGAN.
W71-06232 04A

LAKES
THE GENERATION OF LANGMUIR CIRCULATIONS BY THE EDDY PRESSURE OF SURFACE WAVES,
W71-05871 02H

LAKE CHAMPLAIN IN RELATION TO REGIONAL WATER SUPPLY,
W71-05875 03B

A FIELD STUDY OF LANGMUIR CIRCULATIONS,
W71-05884 02H

A STUDY OF FRESHWATER SAND GRAIN SURFACES BY SCANNING ELECTRON MICROSCOPY,
W71-05887 07B

GEOCHEMICAL SYSTEMS IN ONONDAGA LAKE (CENTRAL NEW YORK STATE) COMPARED WITH THE GREAT LAKES,
W71-05888 02H

GEOLOGICAL, CHEMICAL, AND PHYSICAL ATTRIBUTES OF SEDIMENTS IN SENECA LAKE, NEW YORK,
W71-05890 02J

INTERNAL WAVES OF THE SECOND VERTICAL MODE IN LAKE HURON,
W71-05896 02H

ON THE MECHANISM OF LANGMUIR CIRCULATIONS AND THEIR ROLE IN EPILIMNION MIXING,
W71-05975 02H

PRIMARY PRODUCTION AND CHEMICAL AND PHYSICAL CHARACTERISTICS OF LAKE ASHTABULA RESERVOIR, NORTH DAKOTA,
W71-06008 02H

EUTROPHICATION CAUSE--EFFECT RELATIONSHIPS,
W71-06009 05C

THE EFFECTS OF THERMAL DISCHARGES ON THE STRATIFICATION CYCLE OF LAKES,
W71-06082 05C

REGENERATION OF THE SEVAN,
W71-06330 02H

LAND MANAGEMENT
FRONTIERS IN CONSERVATION.
W71-06129 04C

LAND AND WATER MANAGEMENT FOR MINIMIZING SEDIMENT,
W71-06432 05G

LAND RECLAMATION
ULTIMATE DISPOSAL OF INDUSTRIAL WASTE AN OVERVIEW,
W71-06259 05E

LAND SUBSIDENCE
RECONNAISSANCE INVESTIGATION OF THE SUBSIDENCE OF VENICE AND SUGGESTED STEPS TOWARD ITS CONTROL,
W71-05870 02F

VENICE IS SINKING INTO THE SEA,
W71-06120 02F

LAND USE
GENESEE COUNTY ENVIRONMENTAL HEALTH, CONCLUSIONS REPORT, GENESEE COUNTY, MICHIGAN.
W71-05934 05B

WATERFRONT LAND USE IN THE AUSTRALIAN STATE CAPITALS,
W71-06065 06B

THE WOODSMAN'S ASSAULTS ON THE DOMAIN OF THE CATTLEMAN,
W71-06072 03F

LAND USE FUNCTION IN WATER QUALITY MANAGEMENT,
W71-06310 06B

LAND USE POLICY
LAND USE FUNCTION IN WATER QUALITY MANAGEMENT,
W71-06310 06B

LANDSLIDES
SUBAQUEOUS SLUMP STRUCTURES,
W71-05848 02J

LANGMUIR CIRCULATION
THE GENERATION OF LANGMUIR CIRCULATIONS BY THE EDDY PRESSURE OF SURFACE WAVES,
W71-05871 02H

A FIELD STUDY OF LANGMUIR CIRCULATIONS,
W71-05884 02H

ON THE MECHANISM OF LANGMUIR CIRCULATIONS AND THEIR ROLE IN EPILIMNION MIXING,
W71-05975 02H

LAOS
WATER RESOURCES DEVELOPMENT IN LAOS.
W71-05865 06B

LASER BEAM
LASER BEAM AND POWDER-ACTUATED TOOL SPEED PIPE LAYING.
W71-06354 08C

LC-50
EFFECTS OF ALKYL BENZENE SULFONATE ON RAINBOW TROUT,
W71-06325 05C

LEACHING
RECOVERY OF URANIUM FROM NATURAL MINE WATERS BY COUNTERCURRENT ION EXCHANGE,
W71-05841 05D

LEAD
TOXICITY OF ZINC, COPPER AND LEAD TO CHLOROPHYTA FROM FLOWING WATERS,
W71-05991 05C

LEAD MINING(MO)
POLLUTION FROM MINES IN THE 'NEW LEAD BELT' OF SOUTH EASTERN MISSOURI,
W71-05837 05A

LEAVES
EFFECT OF TIME OF EXPOSURE TO SALINITY ON GROWTH, WATER STATUS AND SALT ACCUMULATION IN BEAN PLANTS,
W71-06074 02I

LEBANON
A COMPARISON OF WATER USE FOR HYBRID CORN IN THE BEKAA AND THE COASTAL PLAIN,
W71-06067 03F

LEECHES
A POTENTIAL CONTROL FOR LEECHES,
W71-06322 05C

LEGAL ASPECTS
THE ENVIRONMENTAL LAWSUIT TRADITIONAL DOCTRINES AND EVOLVING THEORIES TO CONTROL POLLUTION,
W71-06048 05G

WATER-USE LAW AND ADMINISTRATION IN WISCONSIN,
W71-06192 06E

WATER, WATER EVERYWHERE---BUT A STUDY OF THE POLITICO-ADMINISTRATIVE ASPECTS OF WATER DEVELOPMENT IN MONTANA,
W71-06226 06E

LEGAL ASPECTS,
W71-06446 05G

LEGISLATION
WATER POLLUTION OBSERVATIONS ON CONNECTICUT'S RESPONSE,
W71-06047 05G

THE DISCHARGE OF STORM SEWAGE TO PUBLIC WATERS FROM AREAS GROUNDS WHICH ARE ENDANGERED BY OIL, IN CONNECTION WITH T CLEAN WATER ACT FOR BERLIN,
W71-06388 05D

LEHMANN LOVEGRASS
THE SAN SIMON WATERSHED REVEGETATION,
W71-06223 04D

LETTUCE
SEED TABLETS FOR PRECISION PLANTING LETTUCE,
W71-06224 03F

LIFE CYCLES
EFFECTS ON PH ON THE LIFE CYCLE OF THE MIDGE TANYTARSUS DISSIMILIS,
W71-05982 05C

LIFE HISTORY STUDIES
SOME FACTORS INFLUENCING TOXICITY OF LINEAR ALKYLATE SULFONATE (LAS) TO THE BLUEGILL,
W71-06260 05C

LIGHT INTENSITY
REACTION RATES OF PHOTOSYNTHESIS,
W71-06039 05C

LIMNOLOGY
LIMNOLOGY OF ZUNI SALT LAKE, NEW MEXICO,
W71-05846 02H

COLORADO SEMIDRAINAGE MOUNTAIN LAKES,
W71-06165 02H

LINEAR ALKYLATE SULFONATE
SOME FACTORS INFLUENCING TOXICITY OF LINEAR ALKYLATE SULFONATE (LAS) TO THE BLUEGILL,
W71-06260 05C

LINEAR PROGRAMMING
A PROGRAMMING MODEL FOR FARM IRRIGATION SYSTEMS,
W71-05923 03F

LININGS
DRAINAGE AND TREATMENT.
W71-06351 05G

DEPTH OF FLOW AS DESIGN CRITERION FOR CHANNELS WITH ARTIFICIAL LINERS,
W71-06399 08B

LINT
EFFECTS OF IRRIGATION INTENSITY AND NITROGEN LEVEL ON THE PERFORMANCE OF EIGHT VARIETIES OF UPLAND COTTON, GOSSPYIU HIRSUTUM L.,
W71-06068 03F

LINT QUALITY
THE INFLUENCE OF VARIOUS SOIL MOISTURE-REGIMES ON THE YIE AND QUALITY OF COTTON IN AN ARID ZONE,
W71-06217 03F

LIPIDS
ON THE OCCURRENCE OF TRANS-3-HEXADECANOIC ACID IN CHLOREL CELLS, (IN RUSSIAN),
W71-05989 02K

THE INFLUENCE OF ACCLIMATION TEMPERATURE ON THE LIPID COMPOSITION OF FISH GILL MITOCHONDRIA,
W71-06321 05C

LIQUID WASTE
LIQUID HANDLING OF POULTRY MANURE,
W71-06450 05D

LIVESTOCK
ANIMAL WASTE RUNOFF--A MAJOR WATER QUALITY CHALLENGE,
W71-06114 05B

LOADS(FORCES)
VARIATION OF GROUND SNOW LOADS IN BRITISH COLUMBIA,
W71-06140 02C

DEVELOPMENT OF SNOW LOAD DESIGN DATA FOR THE UNITED STATES

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

INDEXES

- SUBJECT INDEX
- AUTHOR INDEX
- ORGANIZATIONAL INDEX
- ACCESSION NUMBER INDEX
